

# Stars and Matter Inside Out: Low Energy Neutrinos at Super- Kamiokande

*Seminar at IITH,*

*2018.5.9*

*Michael Smy,*

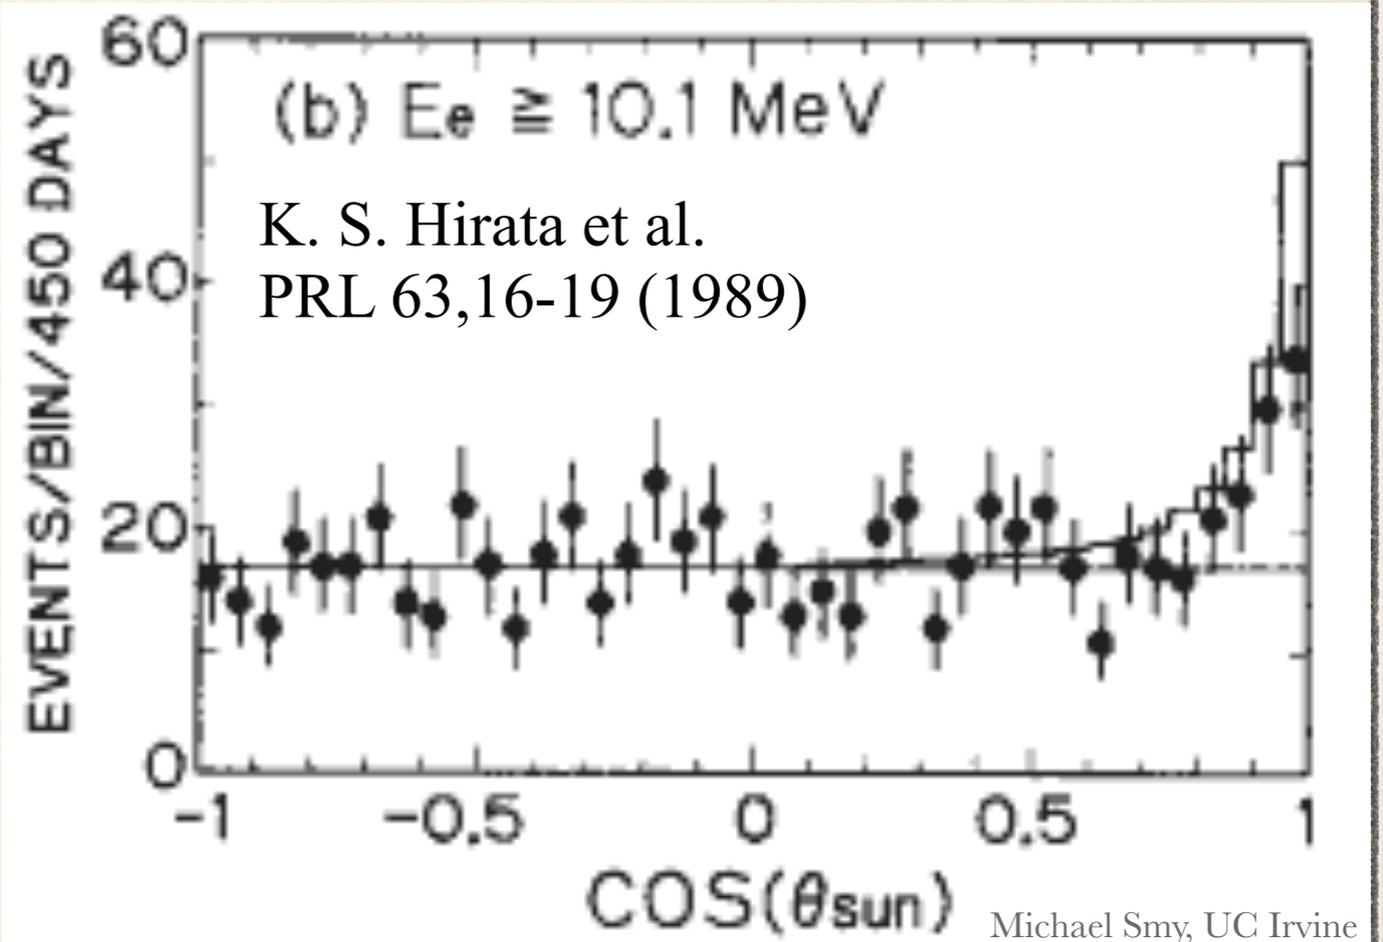

*UCI*

The Sun

All features drawn to scale

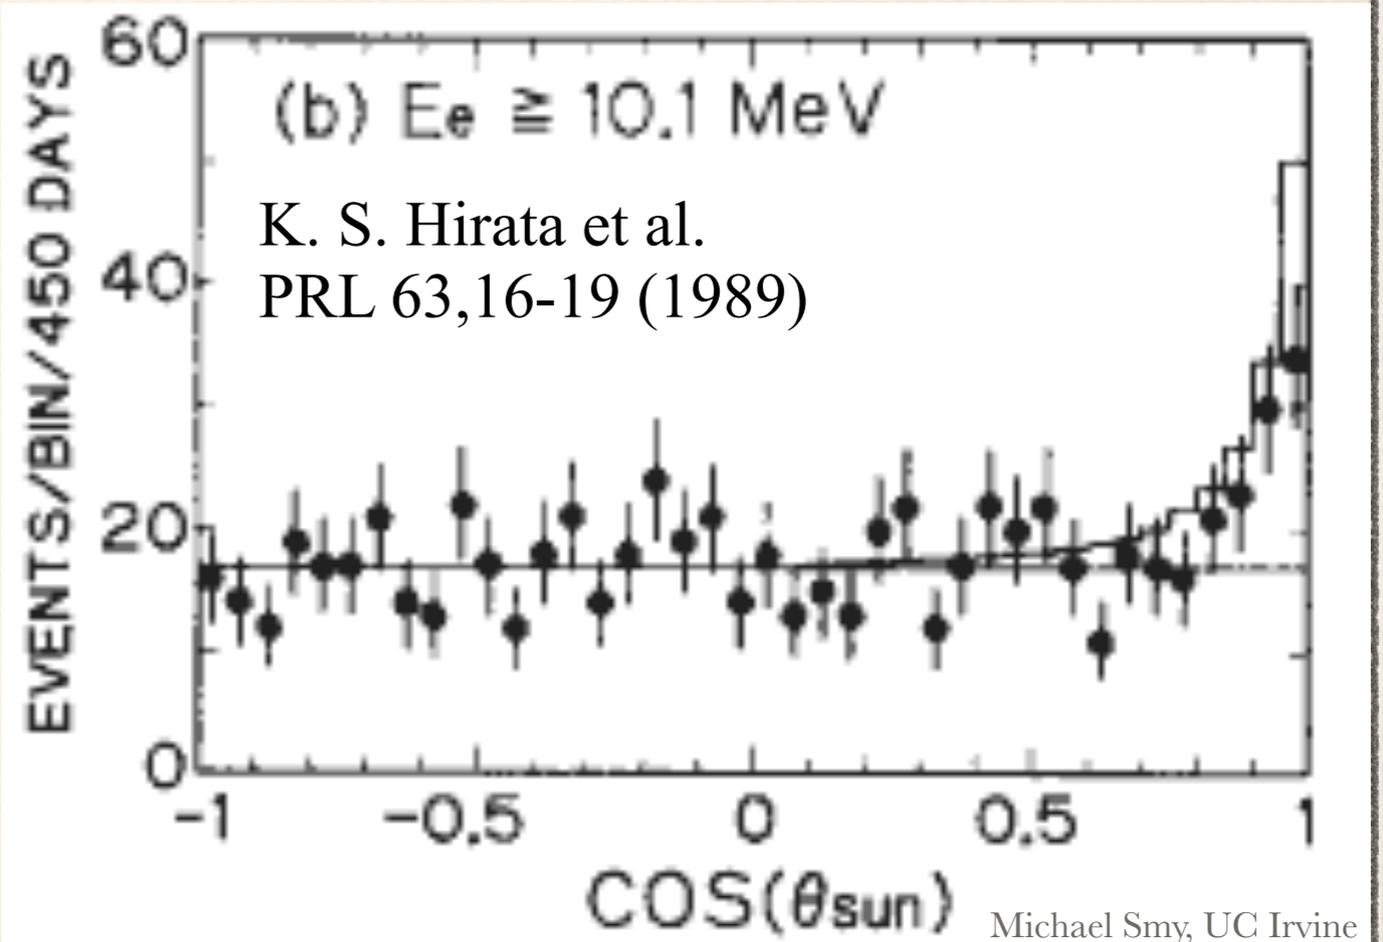

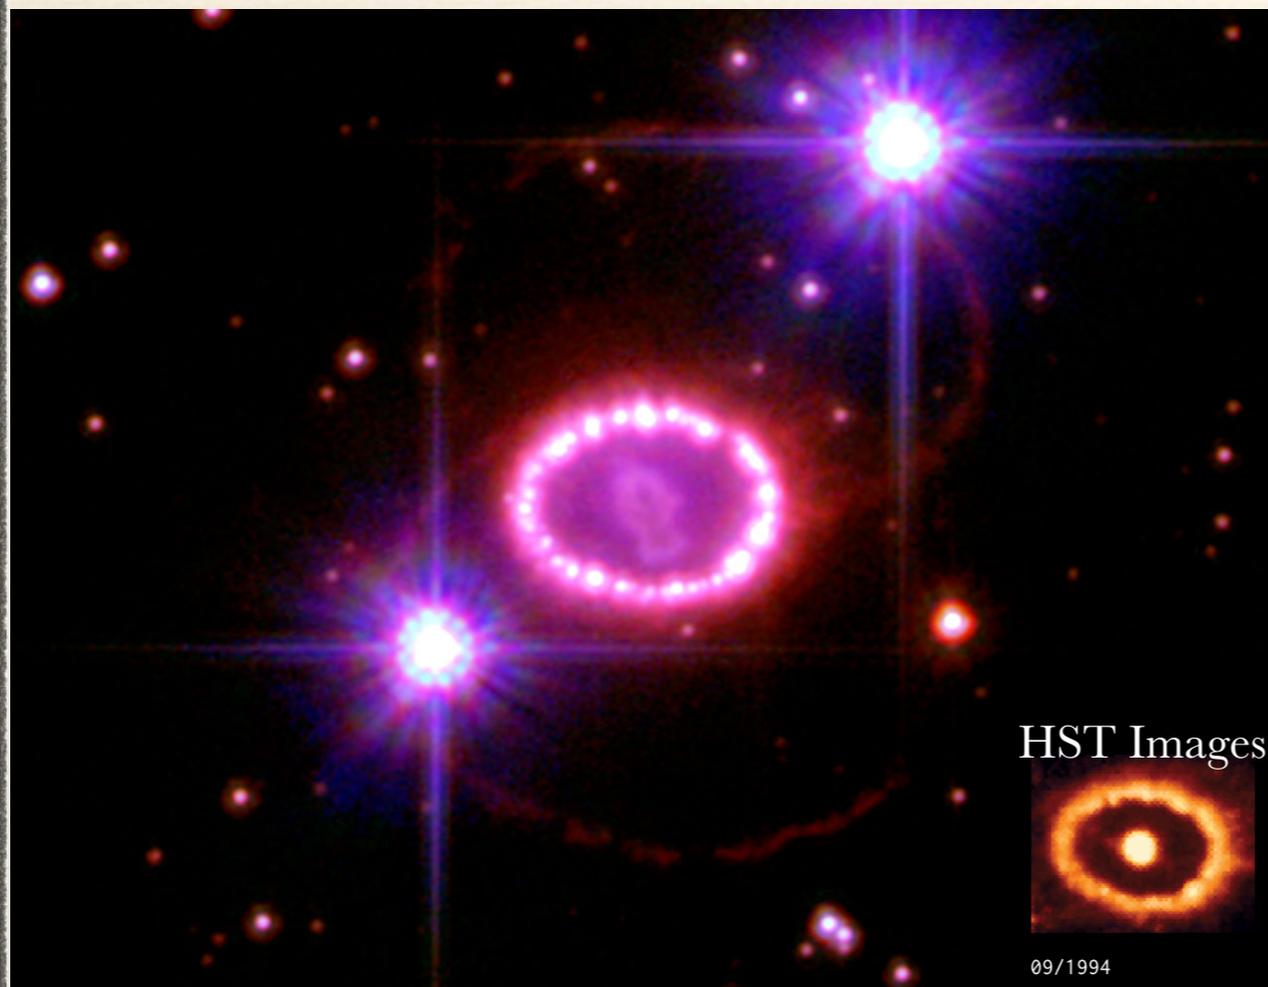

# 1987: Birth of $\nu$ Astronomy

- ❖ Sanduleak -69° 202 (dist.  $\sim 50$  kpc) turned supernova in 1987 and 24  $\nu$  interactions were observed within 13 seconds of each other: 11 by Kamiokande-II, 8 by IMB and 5 by Baksan (BNO)
- ❖ Kamiokande observed an excess of events in the solar direction due to solar neutrino-electron elastic scattering

# 1987: Birth of $\nu$ Astronomy

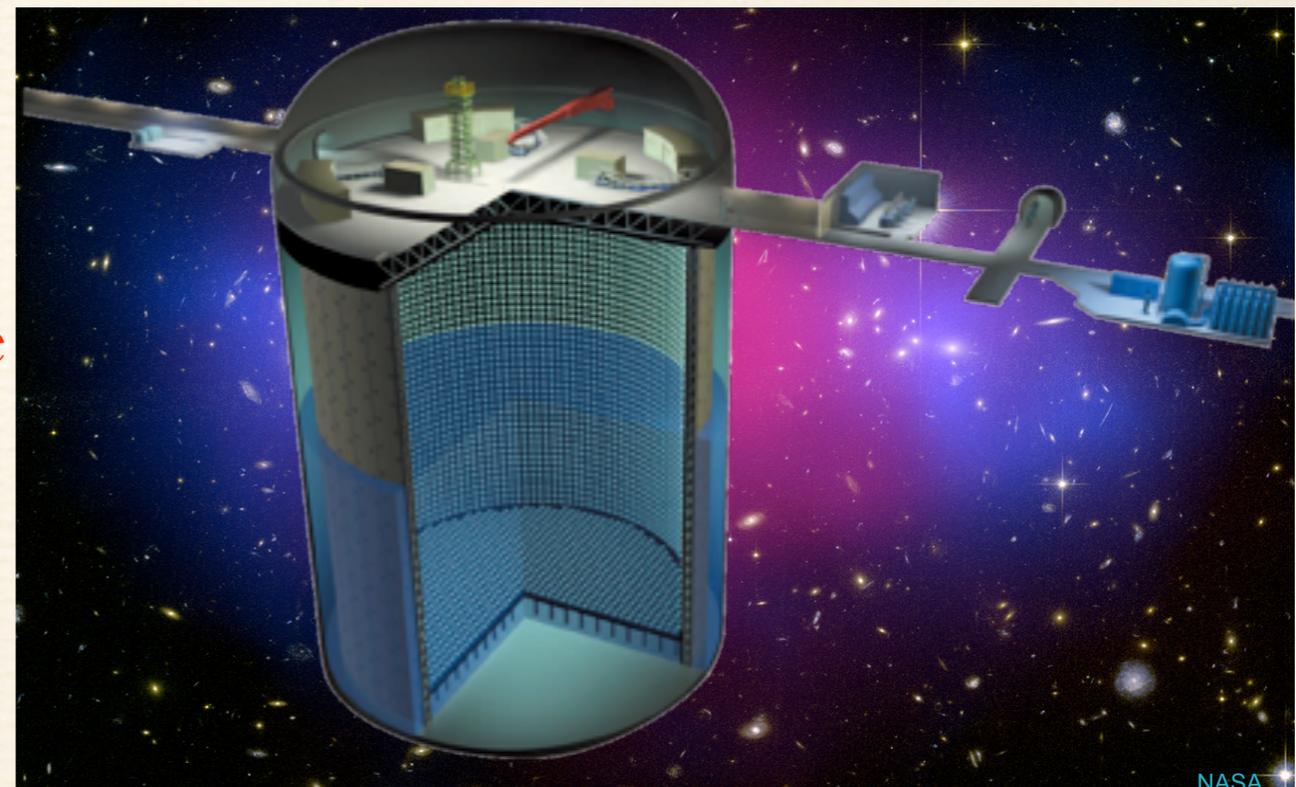

- ❖ Sanduleak -69° 202 (dist.  $\sim 50$  kpc) turned supernova in 1987 and 24  $\nu$  interactions were observed within 13 seconds of each other: 11 by Kamiokande-II, 8 by IMB and 5 by Baksan (BNO)
- ❖ Kamiokande observed an excess of events in the solar direction due to solar neutrino-electron elastic scattering

# 22 Years of Super-Kamiokande!

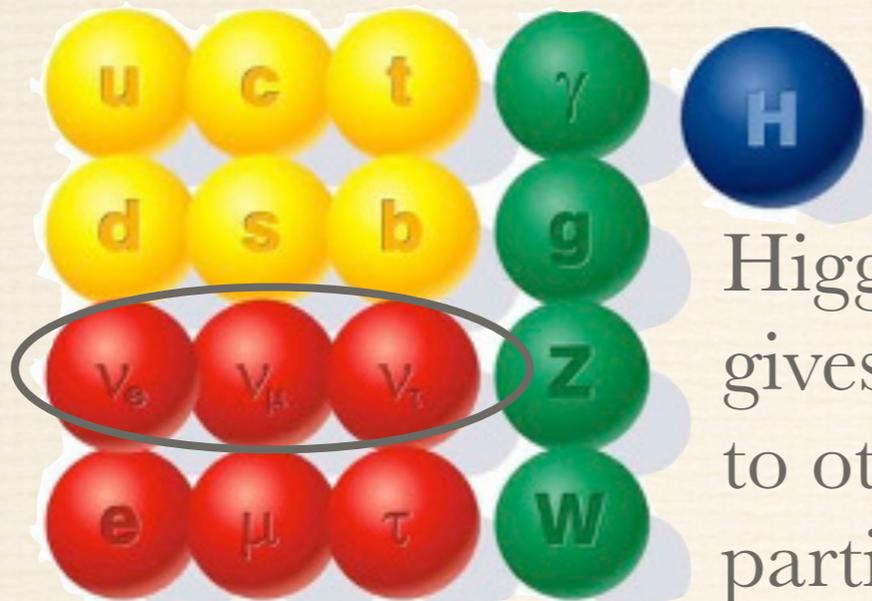

- ❖ 1998: discovery of atmospheric neutrino flavor transformation and neutrino mass
- ❖ 2000: solar mixing angle is large
- ❖ 2001: discovery of solar neutrino flavor transformation with SNO; uniquely measure oscillation parameters (with all solar data)
- ❖ 2004: discovery of atmospheric  $\nu$  oscillation; confirmation from K2K with  $\nu_\mu$  beam
- ❖ 2011: first indication of positive  $\theta_{13}$  from T2K with  $\nu_\mu$  neutrino beam
- ❖ 2012: first evidence for  $\tau$  appearance
- ❖ 2013: first direct indication of matter effects on  $\nu$  oscillations (solar  $\nu$  day/night effect)
- ❖ 2013: first observation of  $\nu_\mu \rightarrow \nu_e$  appearance
- ❖ 2017: first hint of CP violation in  $\nu$  oscillations

- ❖ 50,000 ton water Cherenkov detector
- ❖ ID: 32,000 tons (FV 22,500 tons); 11,129 PMTs (SK-I 11,146 PMTs)
- ❖ OD: 18,000 tons; 1,885 PMTs

# Fundamental Particles

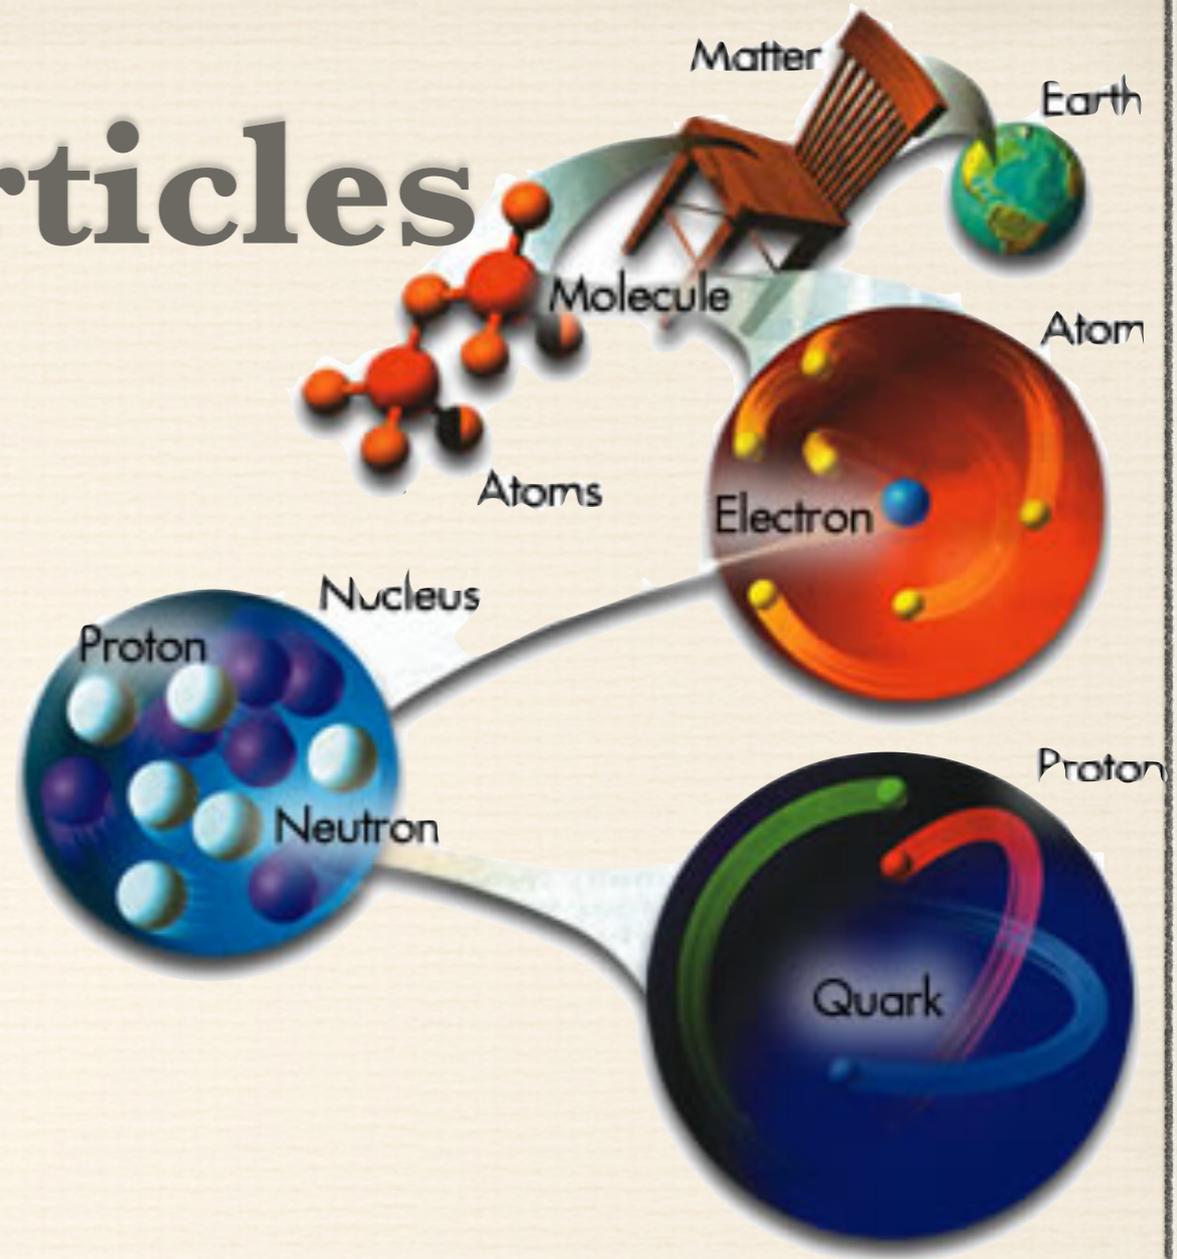

Modern “Periodic Table”

 quarks

 leptons

 force carriers

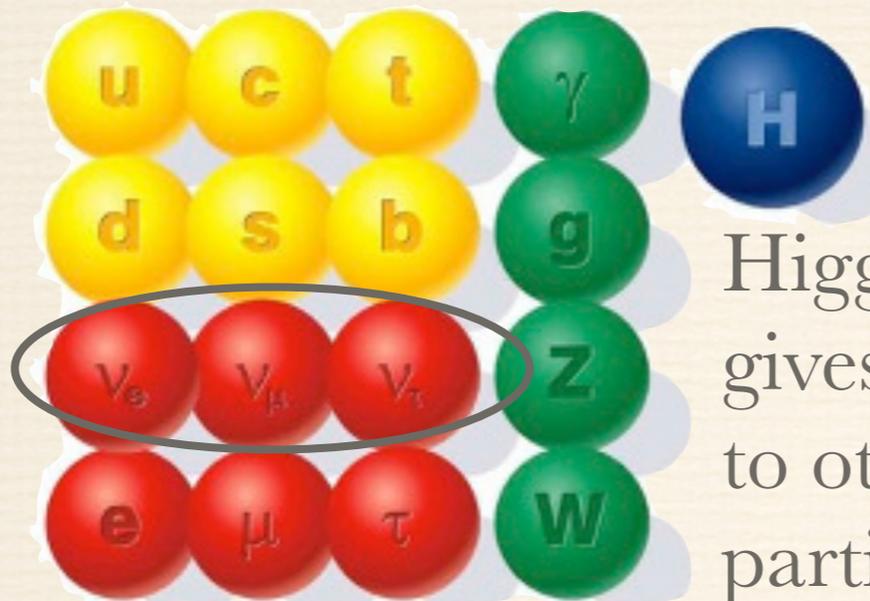

## Forces

- ❖  $\gamma$ : electromagnetic force holds atoms and molecules together
- ❖  $g$ : strong force binds quarks into protons/neutrons, nucleons into nuclei
- ❖  $W$ : weak force changes leptons (quarks) into other leptons (quarks)
- ❖  $Z$ : weak force interactions without affecting lepton/quark “type”
- ❖ (gravity holds solar system and galaxy together)

# Fundamental Particles

Modern “Periodic Table”

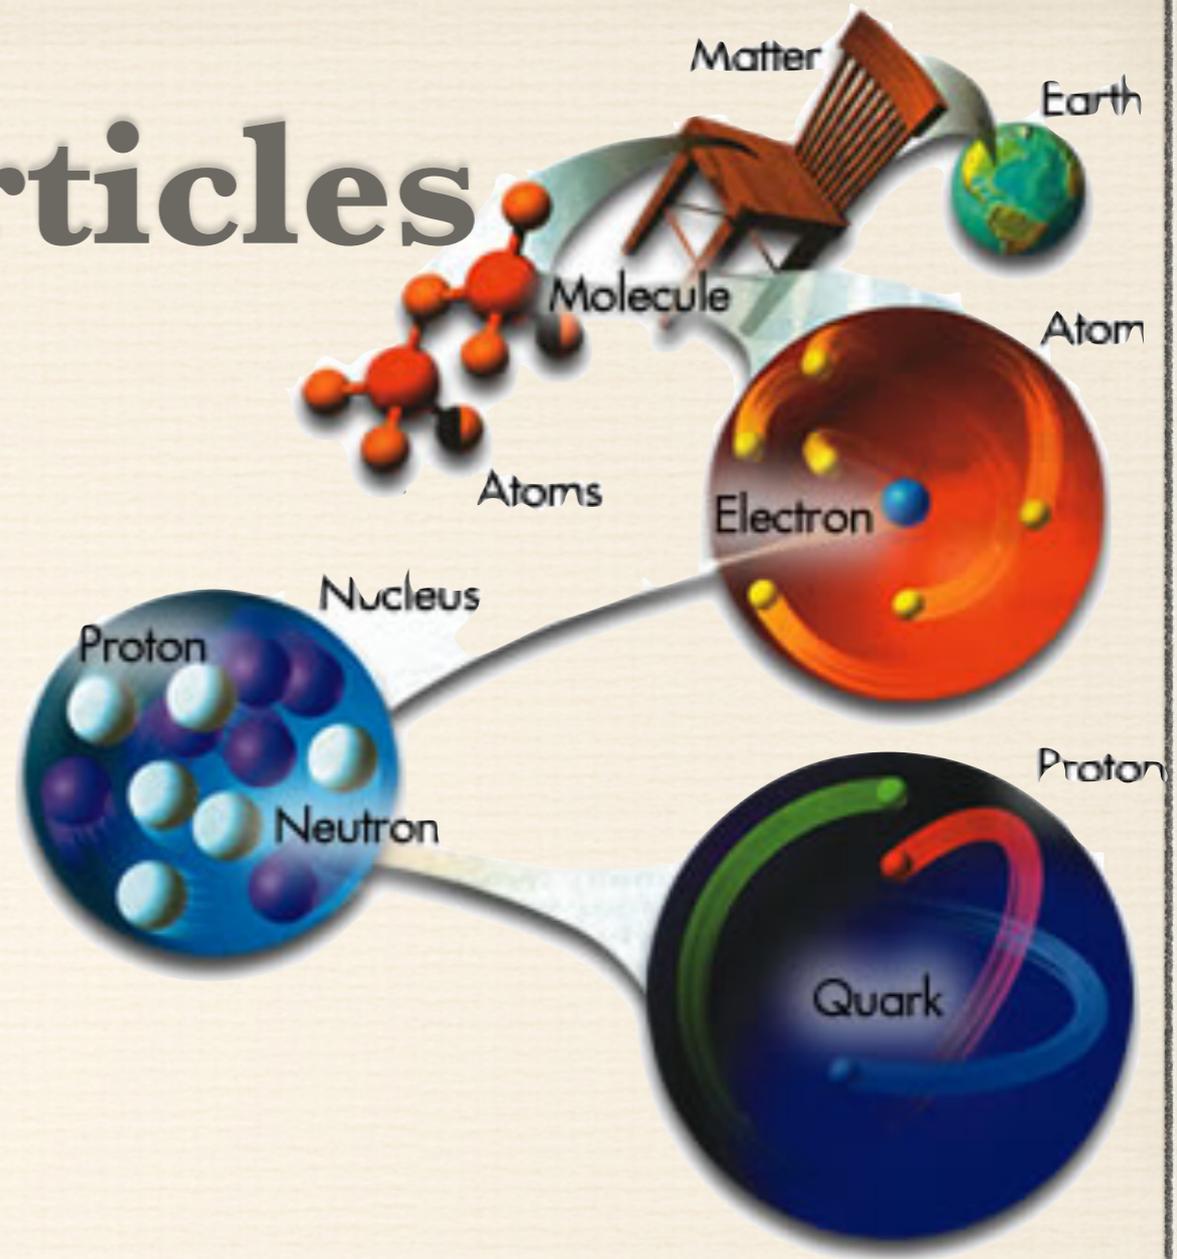

Higgs boson gives mass to other particles

 quarks

 leptons

 force carriers

Forces required to make the stars shine:

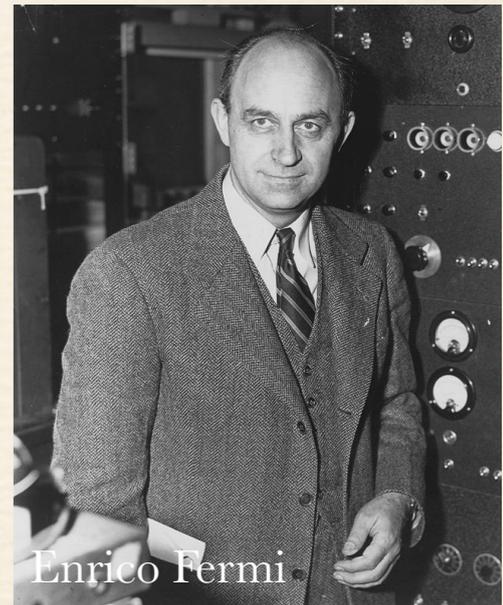

- ❖  $\gamma$ : transports energy from stellar nuclear fusion
- ❖  $g$ : strong force fuses light nuclei into heavier ones in stars releasing energy
- ❖  $W$ : weak force produces neutrons from protons in stars
- ❖ gravity confines stellar plasma

# Neutrinos

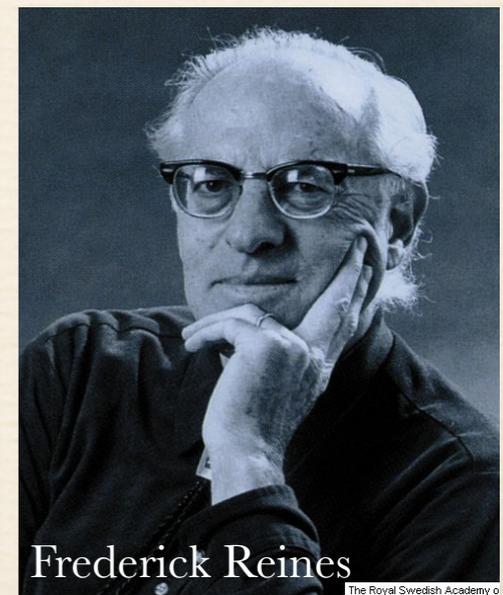

- ❖ invented in 1930 as electrically neutral fundamental particles to rescue conservation of energy in nuclear  $\beta$  decay
- ❖ interactions described in 1933
- ❖ discovered in 1956
- ❖ weak interactions ( $W$ 's) may change “left-handed” leptons  $e^-/\mu^-/\tau^-$  into corresponding neutrino states ( $\nu_e/\nu_\mu/\nu_\tau$ ) and vice versa
- ❖ neutrinos also scatter off quarks and leptons by “neutral current” weak interactions ( $Z$ 's) independent of the type (“flavor”)

Wolfgang Pauli

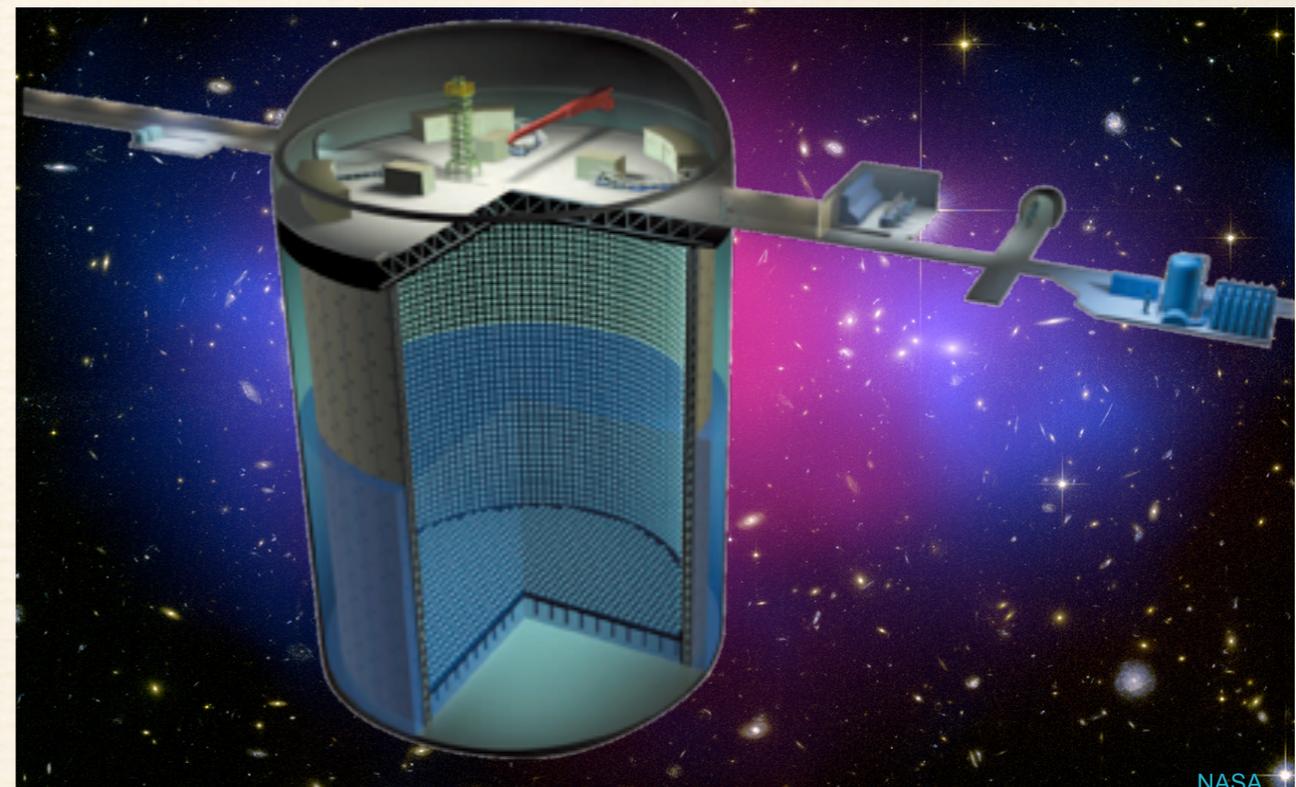

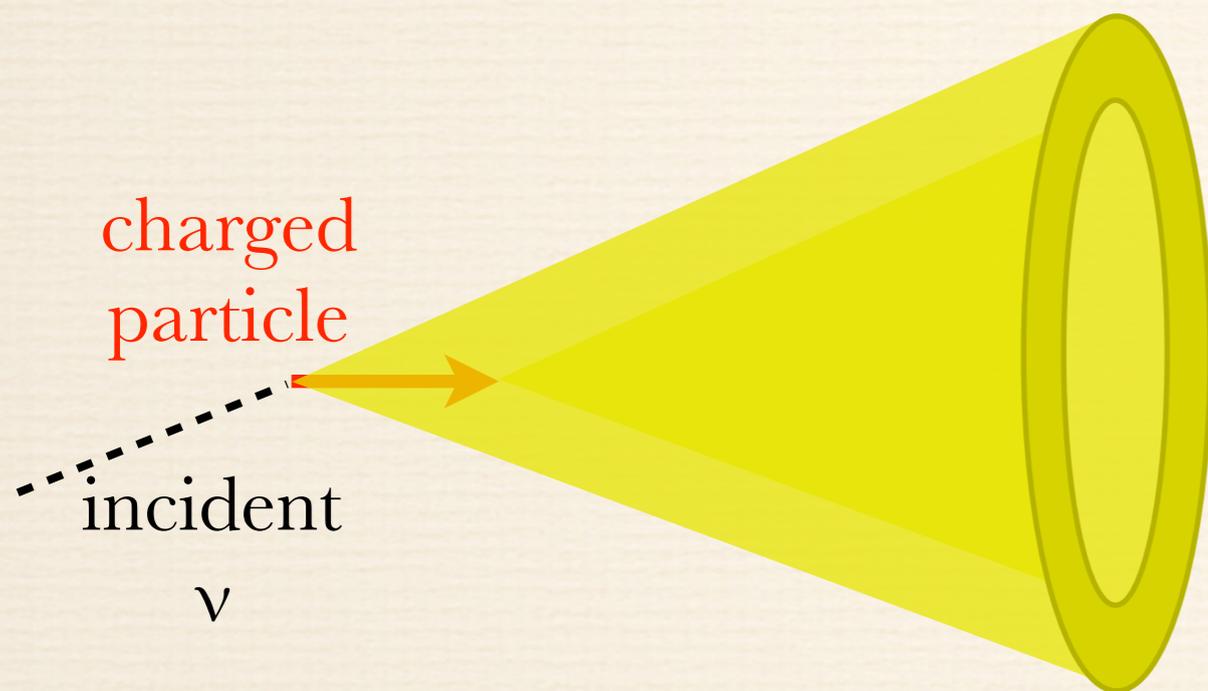

Enrico Fermi

Frederick Reines

# Neutrinos in Cherenkov Detectors

- ❖ Cherenkov-Det.: transparent medium surrounded by light sensors
- ❖ neutrinos produce charged particles moving faster than the speed of light in the medium (e.g. water)

- ❖ charged particles emit Cherenkov light in a cone
- ❖ light sensors record time and intensity of the Cherenkov light
- ❖ reconstruct track(s) of charged particle(s) from timing & intensity

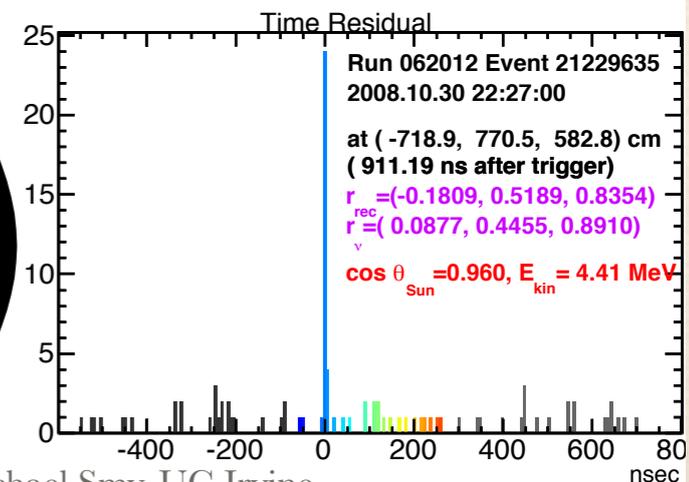

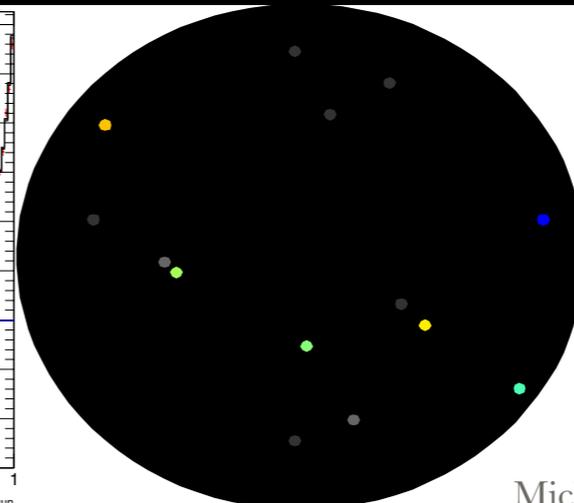

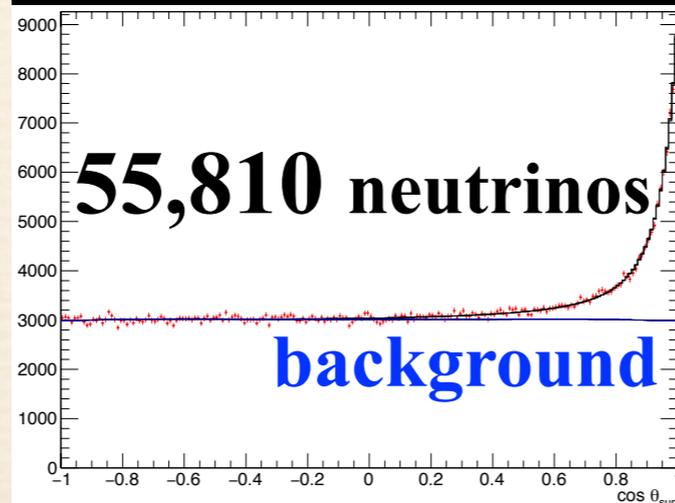

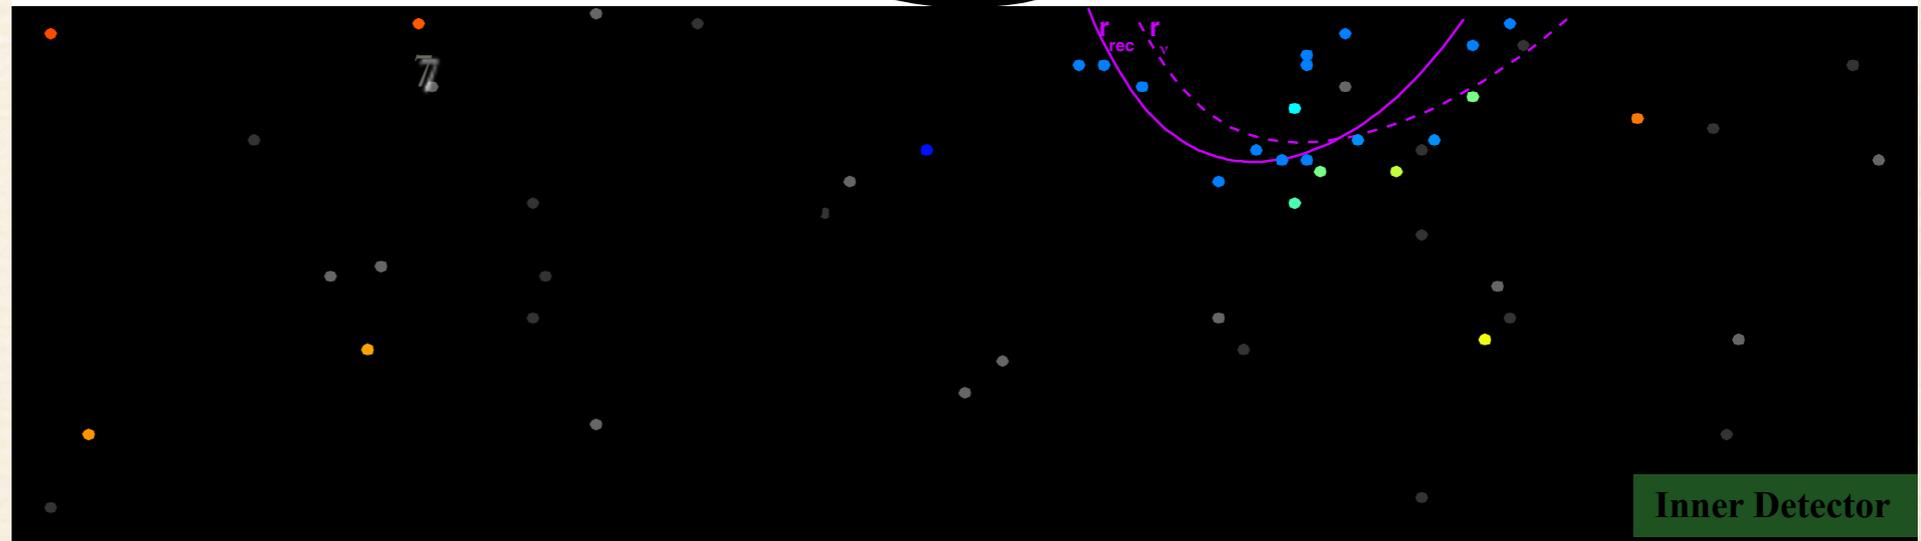

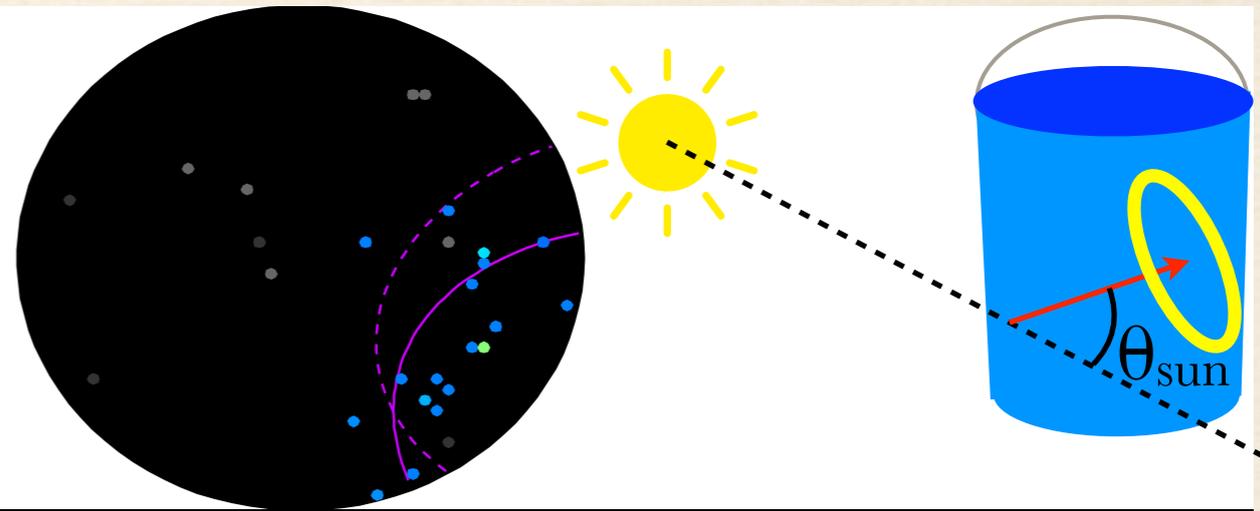

# Solar Neutrinos in Super-K: Recoil $e^-$ from Elastic Scattering

- ❖ PMT timing  $\rightarrow$  location of interaction:  
 **$\sim 60\text{cm error}$**
- ❖ hit pattern  $\rightarrow$  particle direction:  
 **$\sim 30^\circ \text{ error}$**
- ❖ brightness  $\rightarrow$  energy:  **$14\% @ 10 \text{ MeV error}$**   
( $\approx 6 \text{ hits/MeV}$  above threshold)

SK solar neutrino

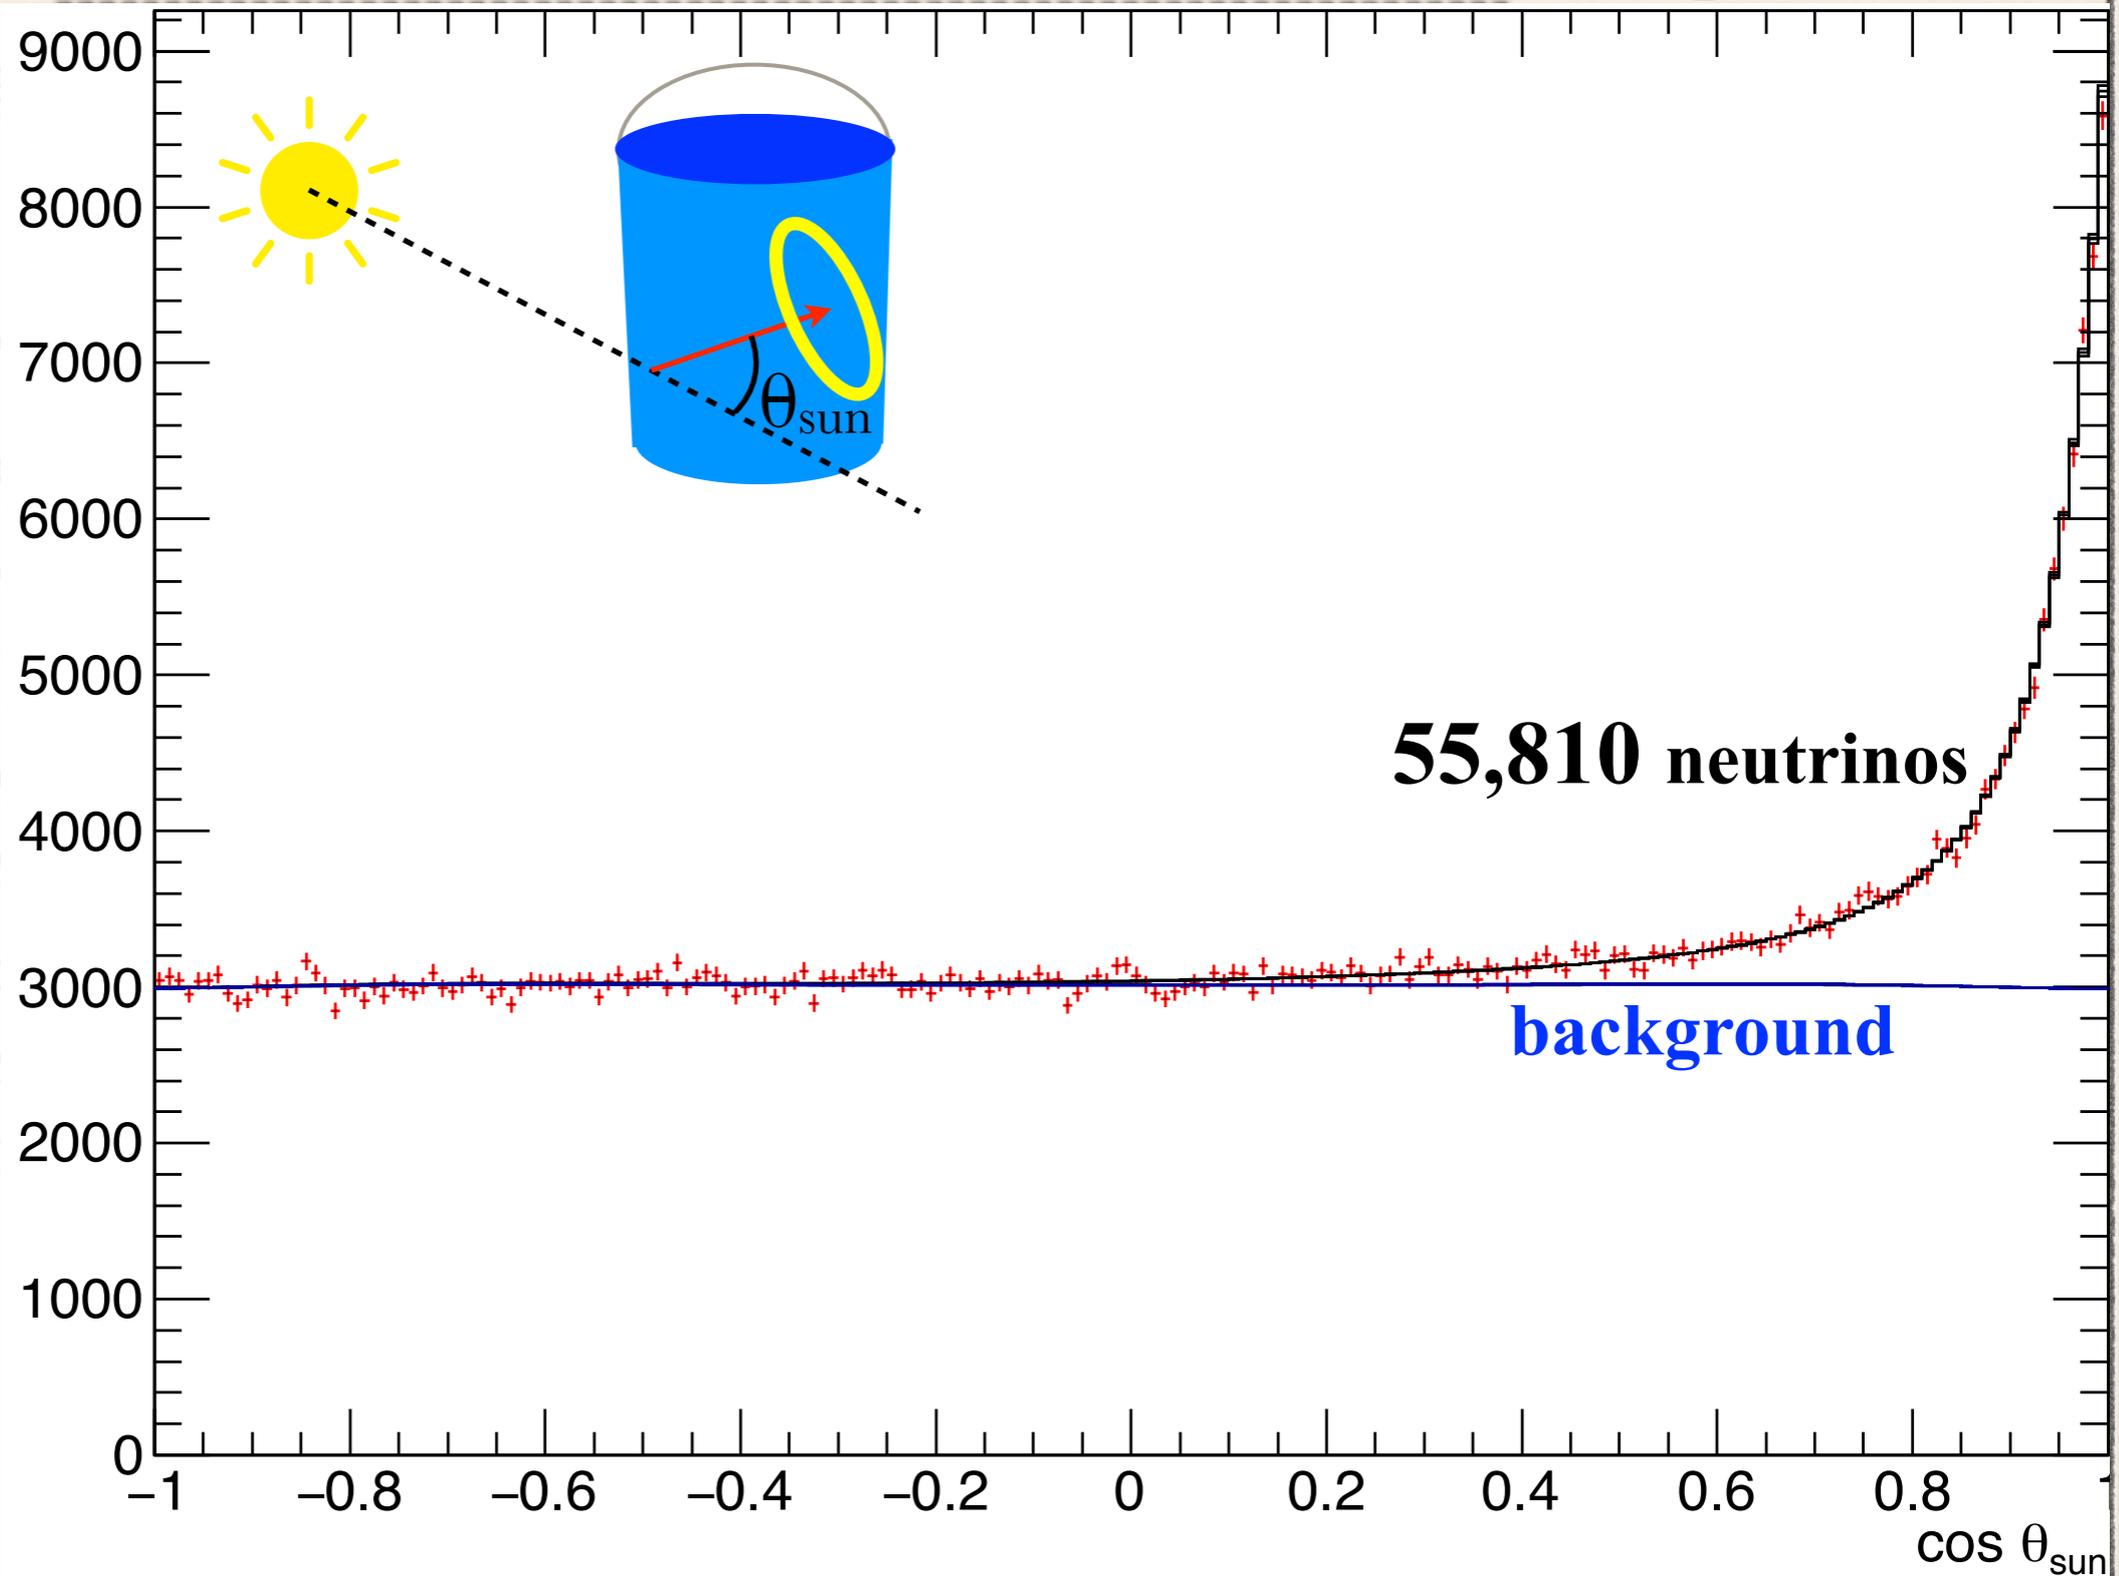

$$E_{e\text{-kin}} = 4.4 \text{ MeV}$$

$$\cos \theta_{\text{sun}} = 0.96$$

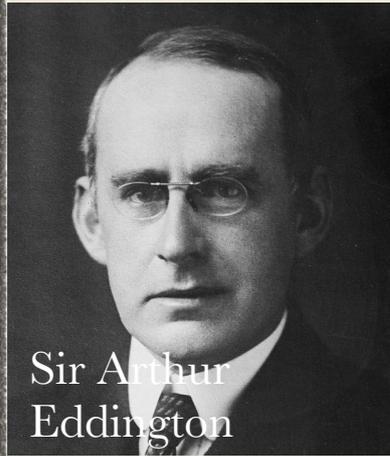

# Solar Neutrinos in Super-K: Recoil $e^-$ from Elastic Scattering

- ❖ PMT timing  
location of  
interaction:  
 **$\sim 60\text{cm error}$**
- ❖ hit pattern  $\rightarrow$   
particle dire  
 **$\sim 30^\circ$  error**
- ❖ brightness  $\rightarrow$   
energy: **14%**  
**10 MeV error**  
( $\approx 6$  hits/Me  
above thresh

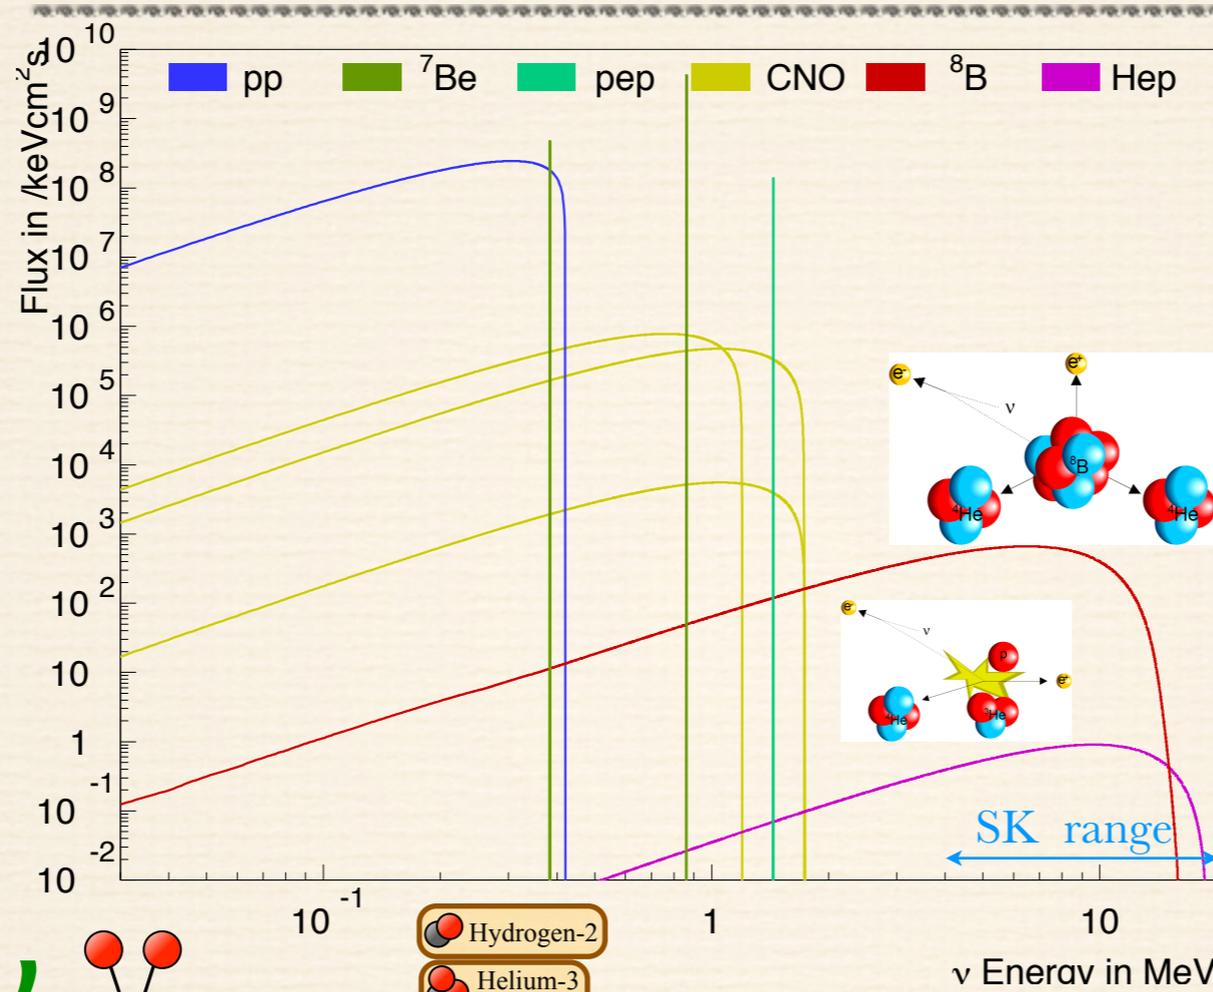

# Stellar Fusion and Neutrinos

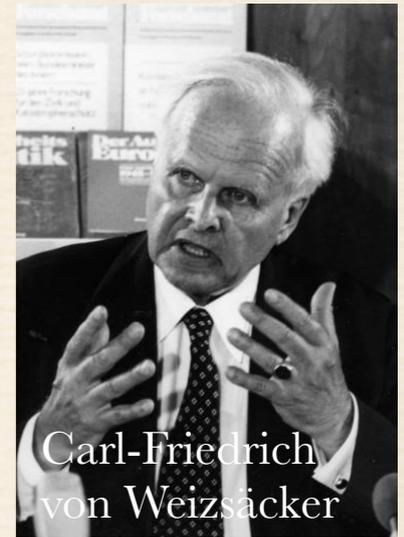

Sir Arthur Eddington

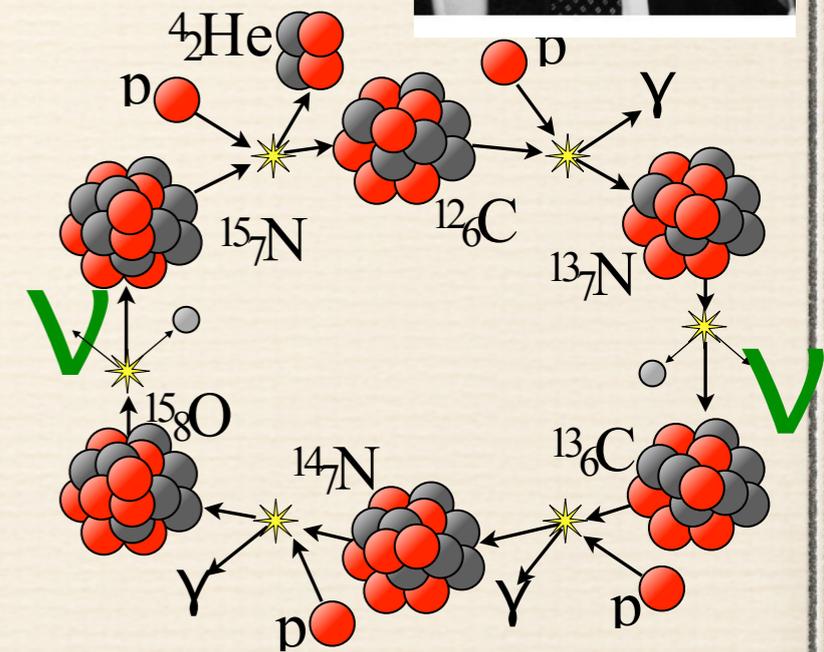

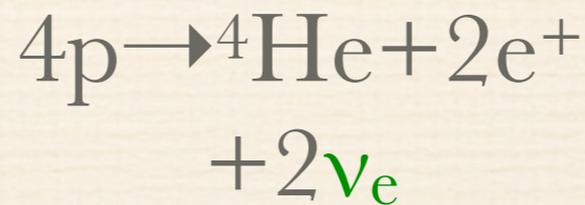

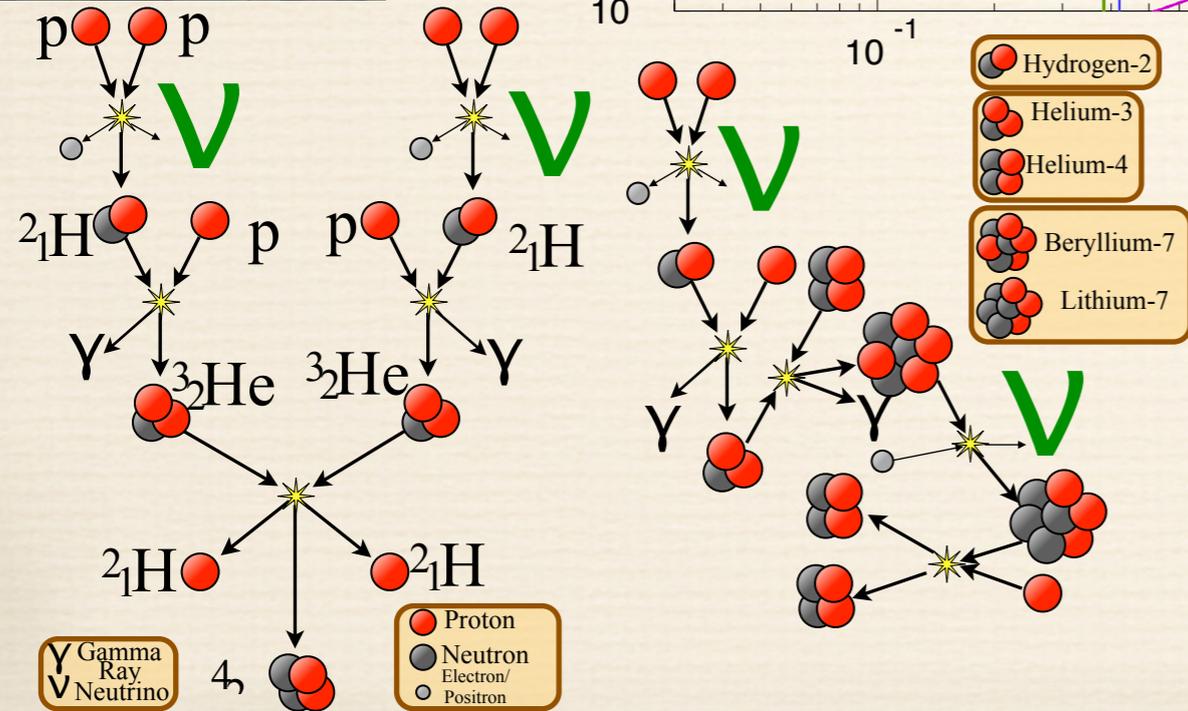

Hans Bethe

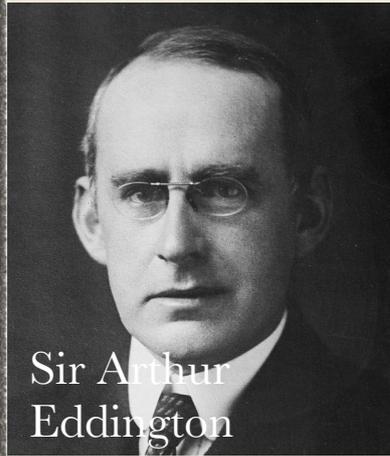

John Bahcall

Carl-Friedrich von Weizsäcker

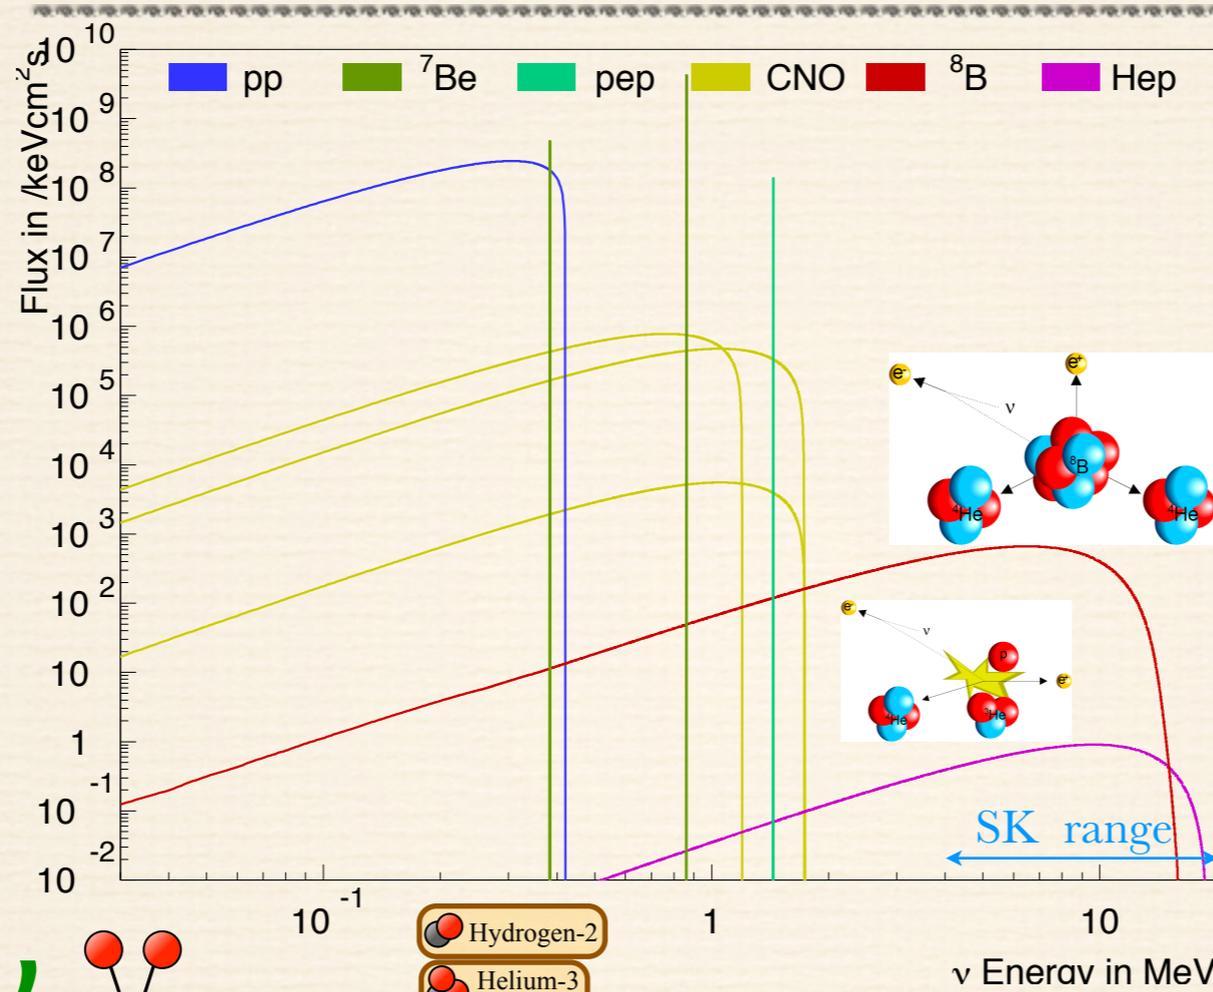

# Stellar Fusion and Neutrinos

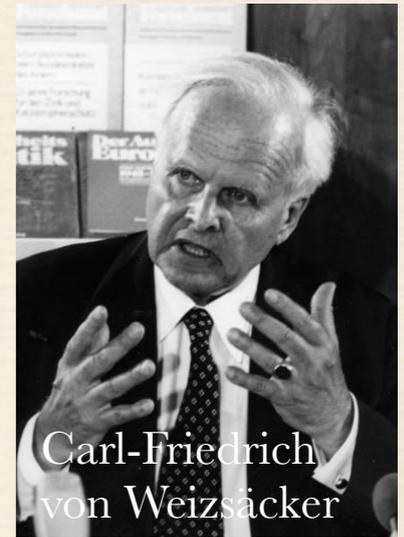

Sir Arthur Eddington

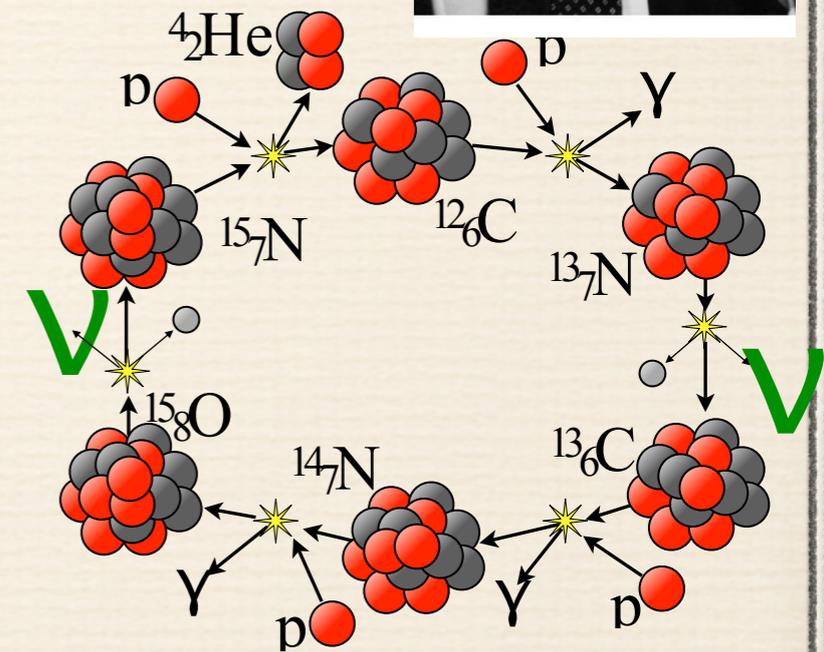

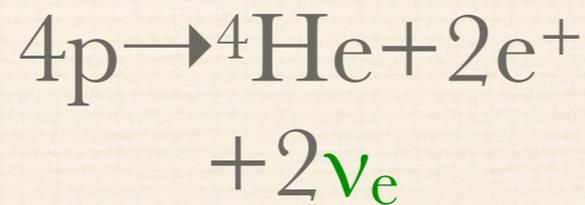

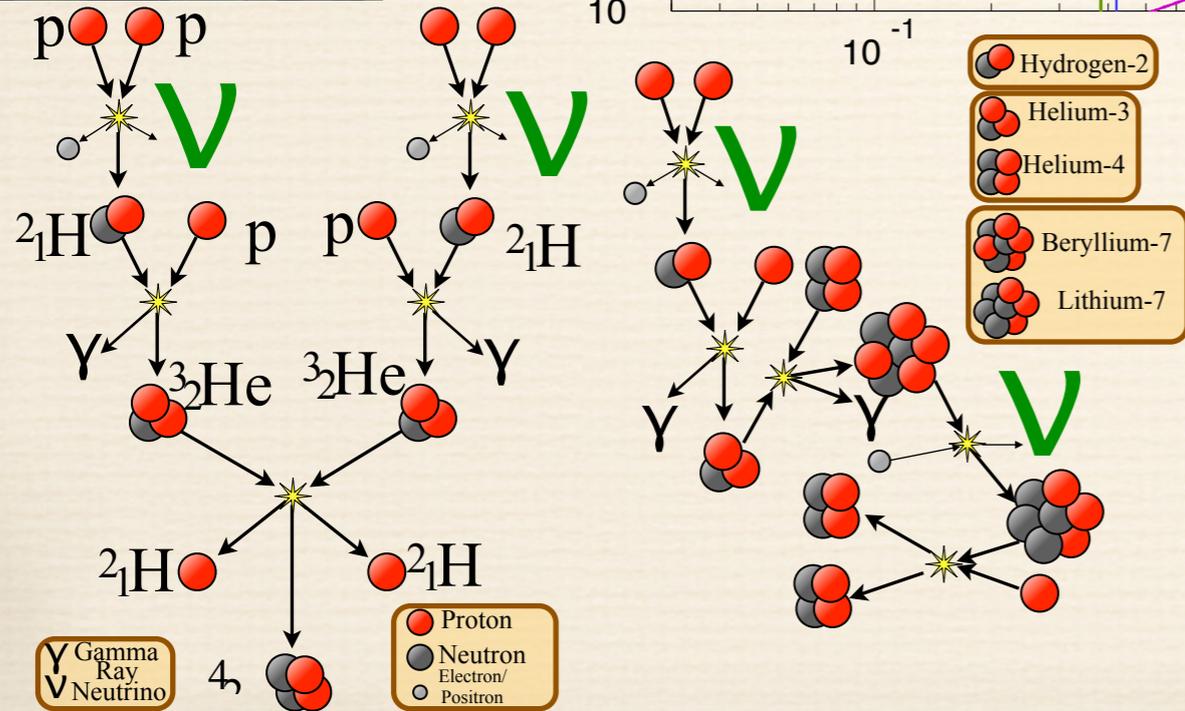

Hans Bethe

John Bahcall

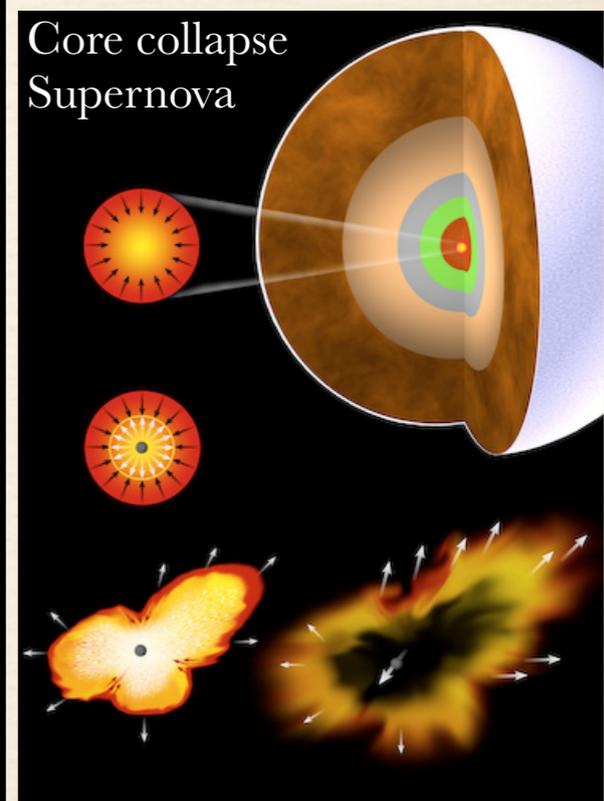

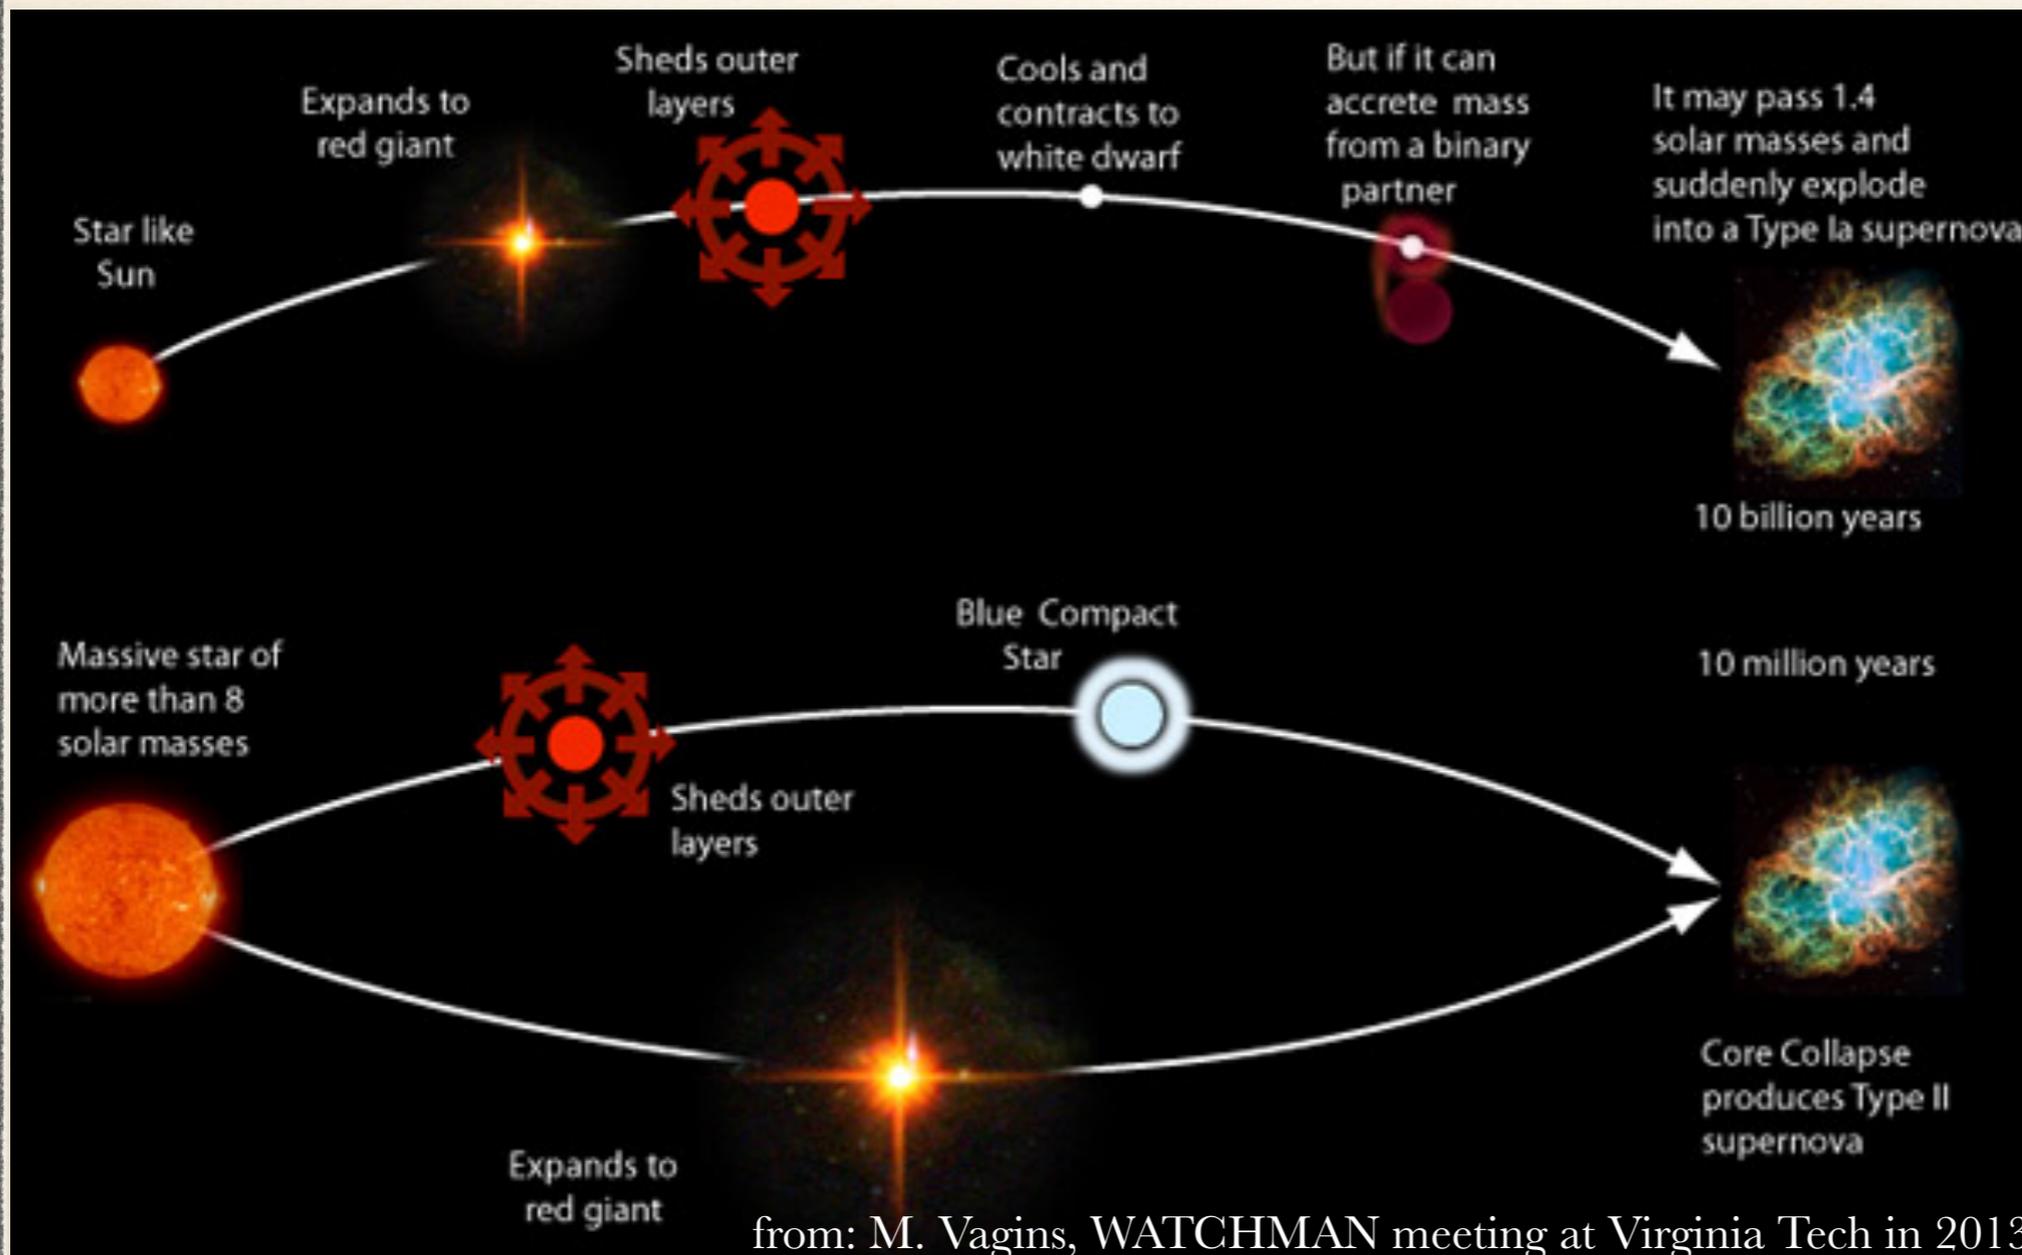

Carl-Friedrich von Weizsäcker

# Supernova Explosions

- ❖ origin of heavy elements  $> \text{He}$  (or stars would just keep theirs)
- ❖ production of elements heavier than Fe (also: n star mergers)
- ❖ very energetic, interesting events: core collapse supernovae release about three sextillion Yottawatts for  $\sim 10$  seconds!

from: M. Vagins, WATCHMAN meeting at Virginia Tech in 2013

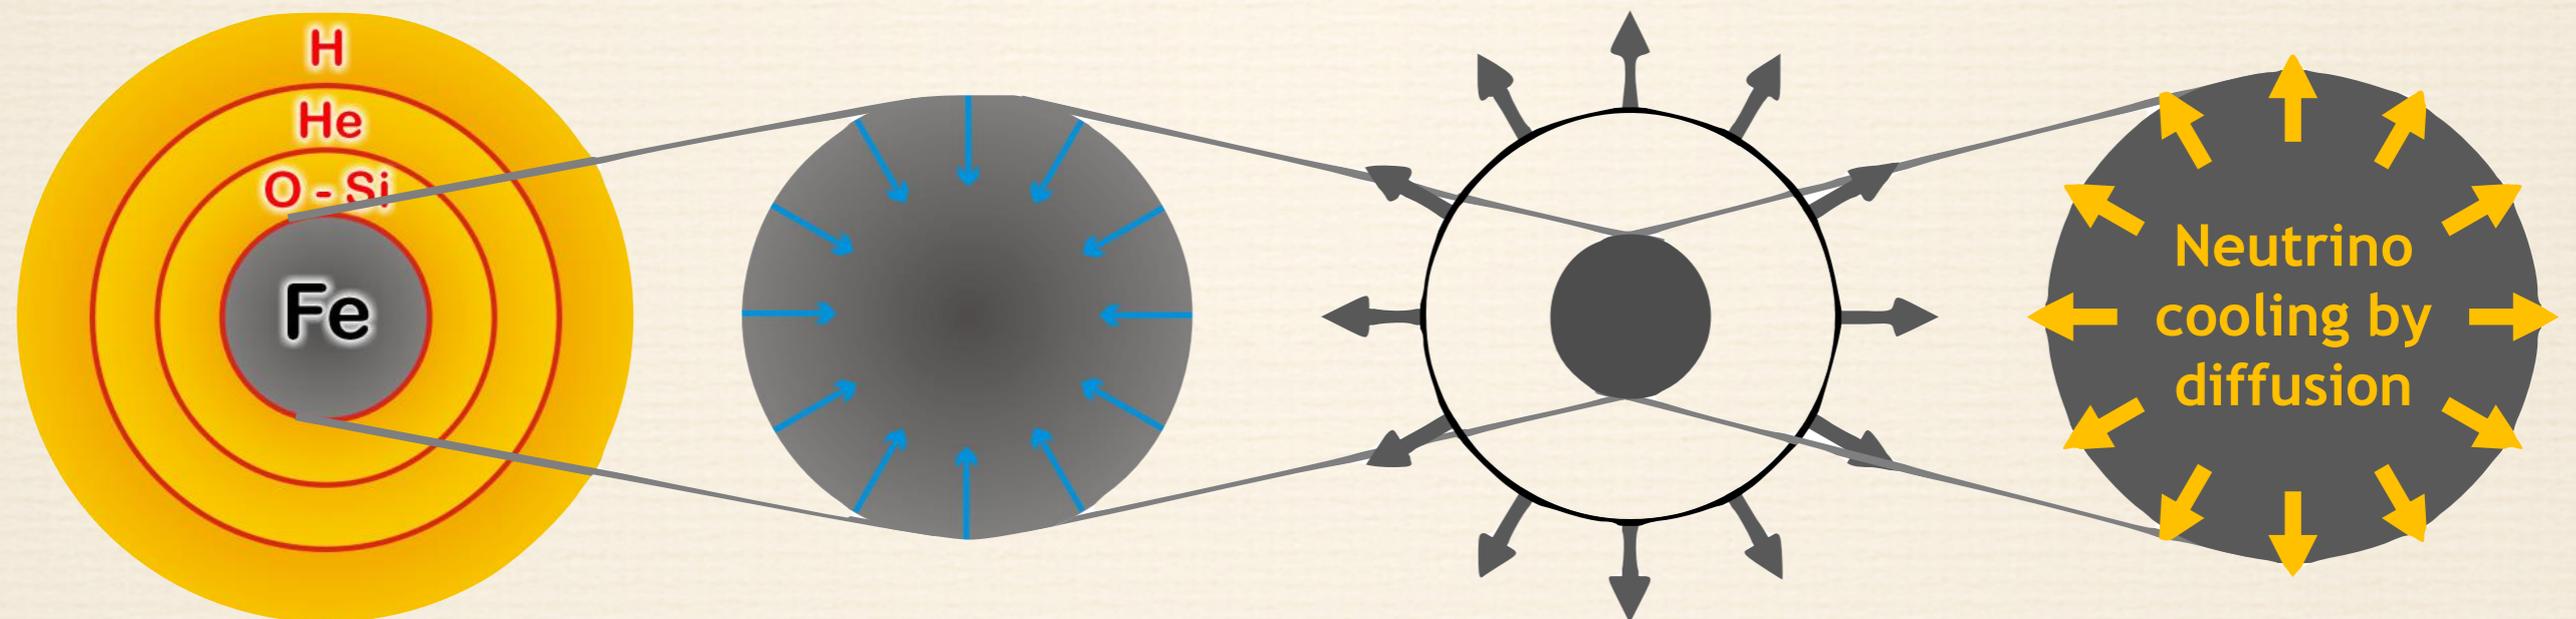

# Core-Collapse Supernova Explosion: The $\nu$ Bomb!

End state of a  
massive star  
 $M \gtrsim 6-8 M_{\odot}$

Collapse of  
degenerate core

Bounce at  $\rho_{\text{nuc}}$   
Shock wave forms  
explodes the star

Grav. binding  $E$   
 $\sim 3 \times 10^{53}$  erg  
emitted as nus  
of all flavors

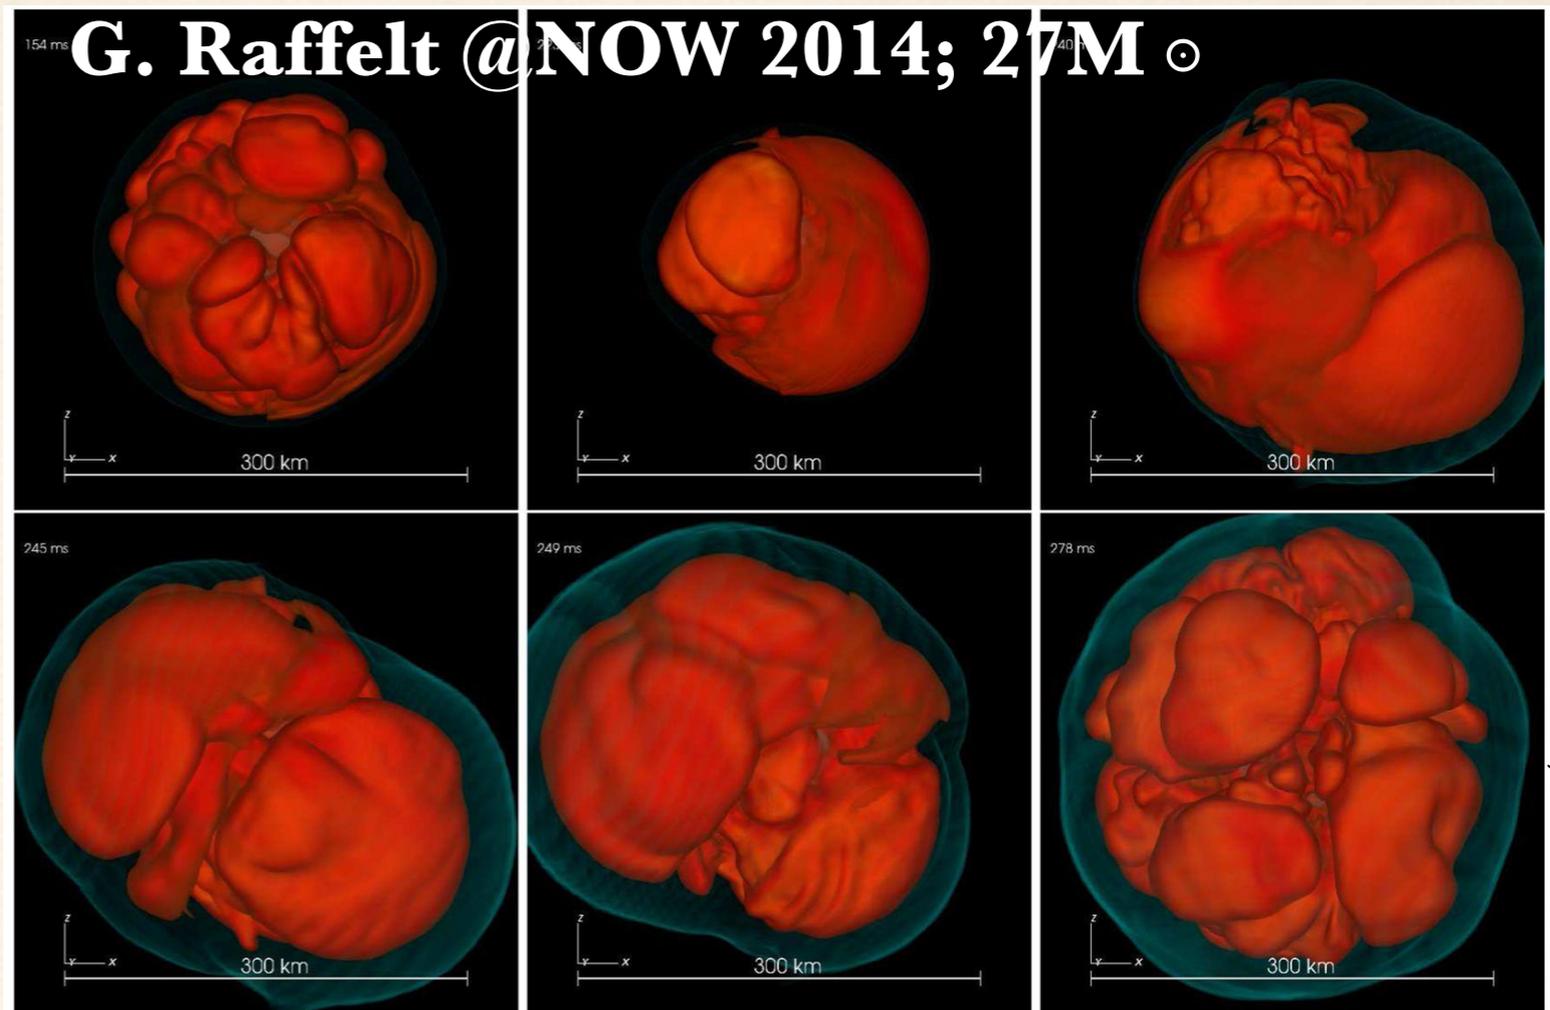

- ❖  $\sim 99\%$  of energy released into neutrinos
- ❖  $\sim 0.01\%$  goes into light emission!
- ❖ must understand neutrinos to understand these events!

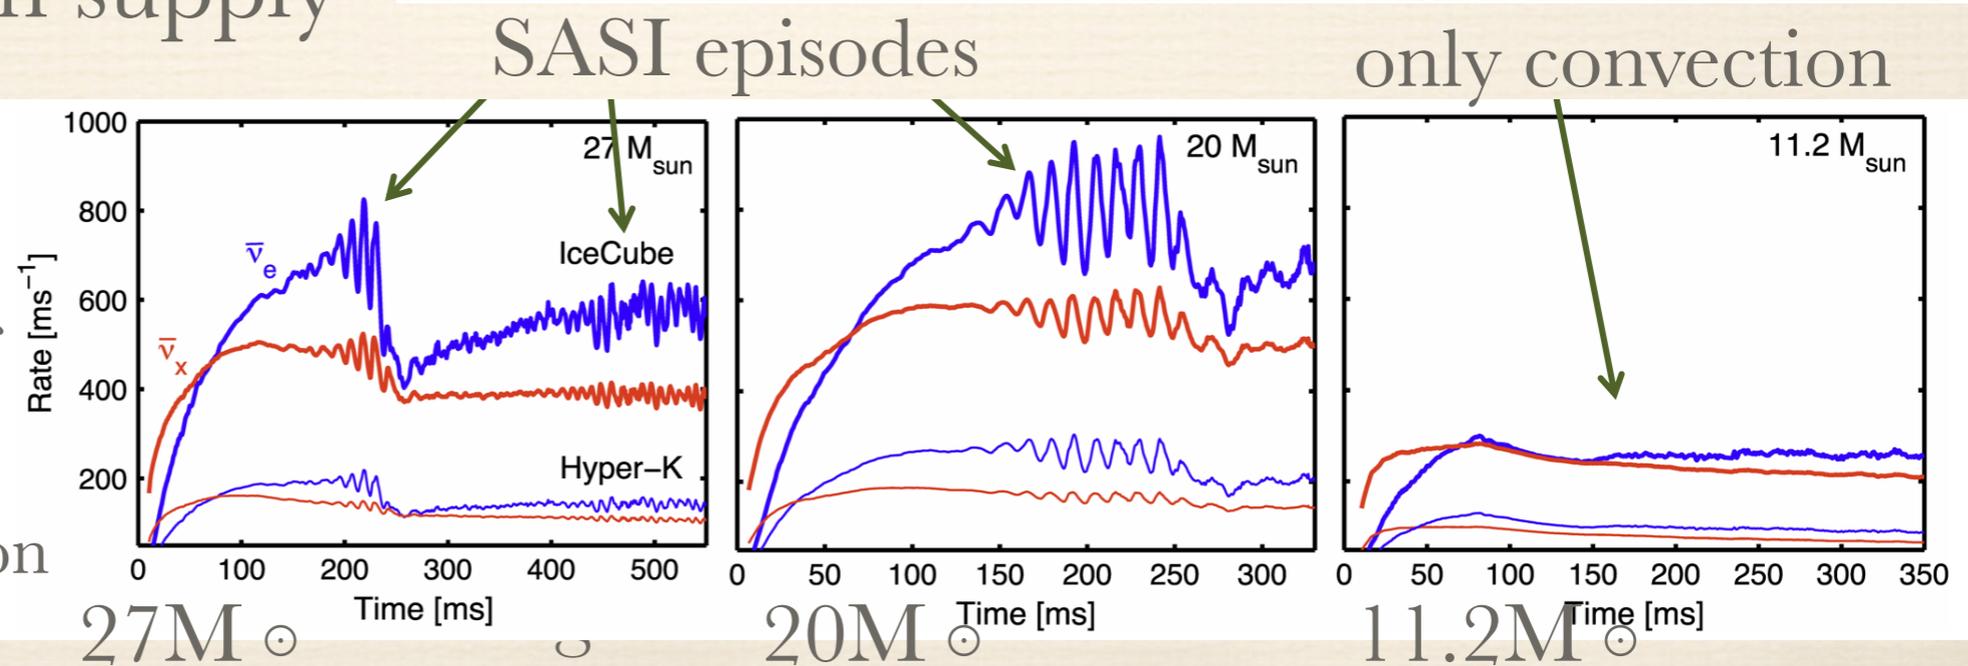

Courtesy G. Raffelt @ NOW 2014

# Neutrinos Power the Explosion

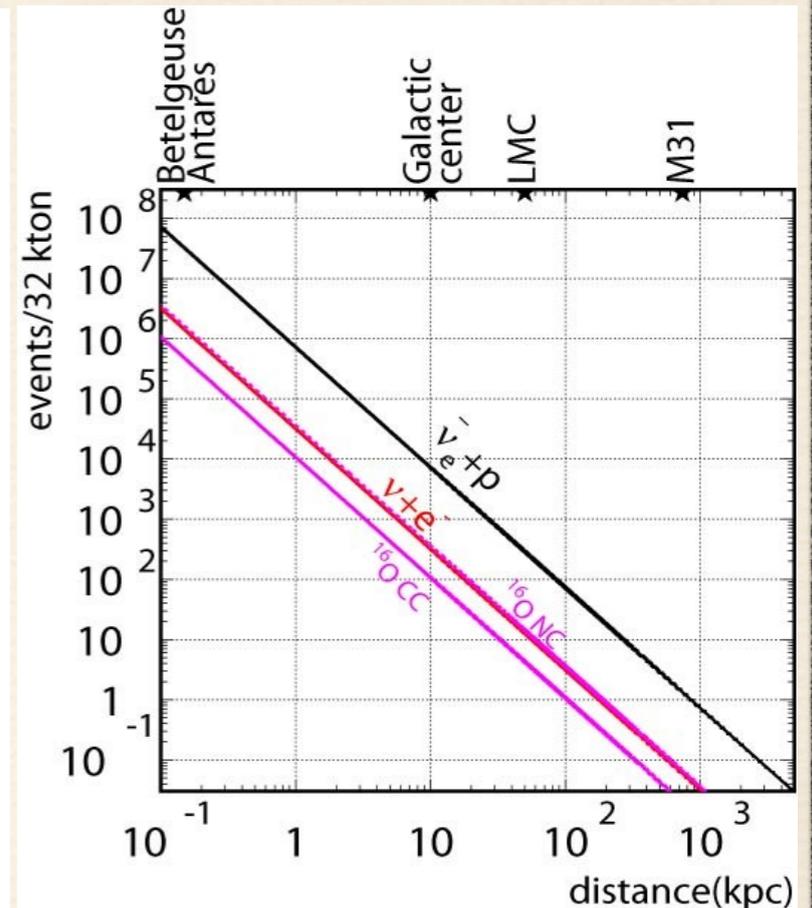

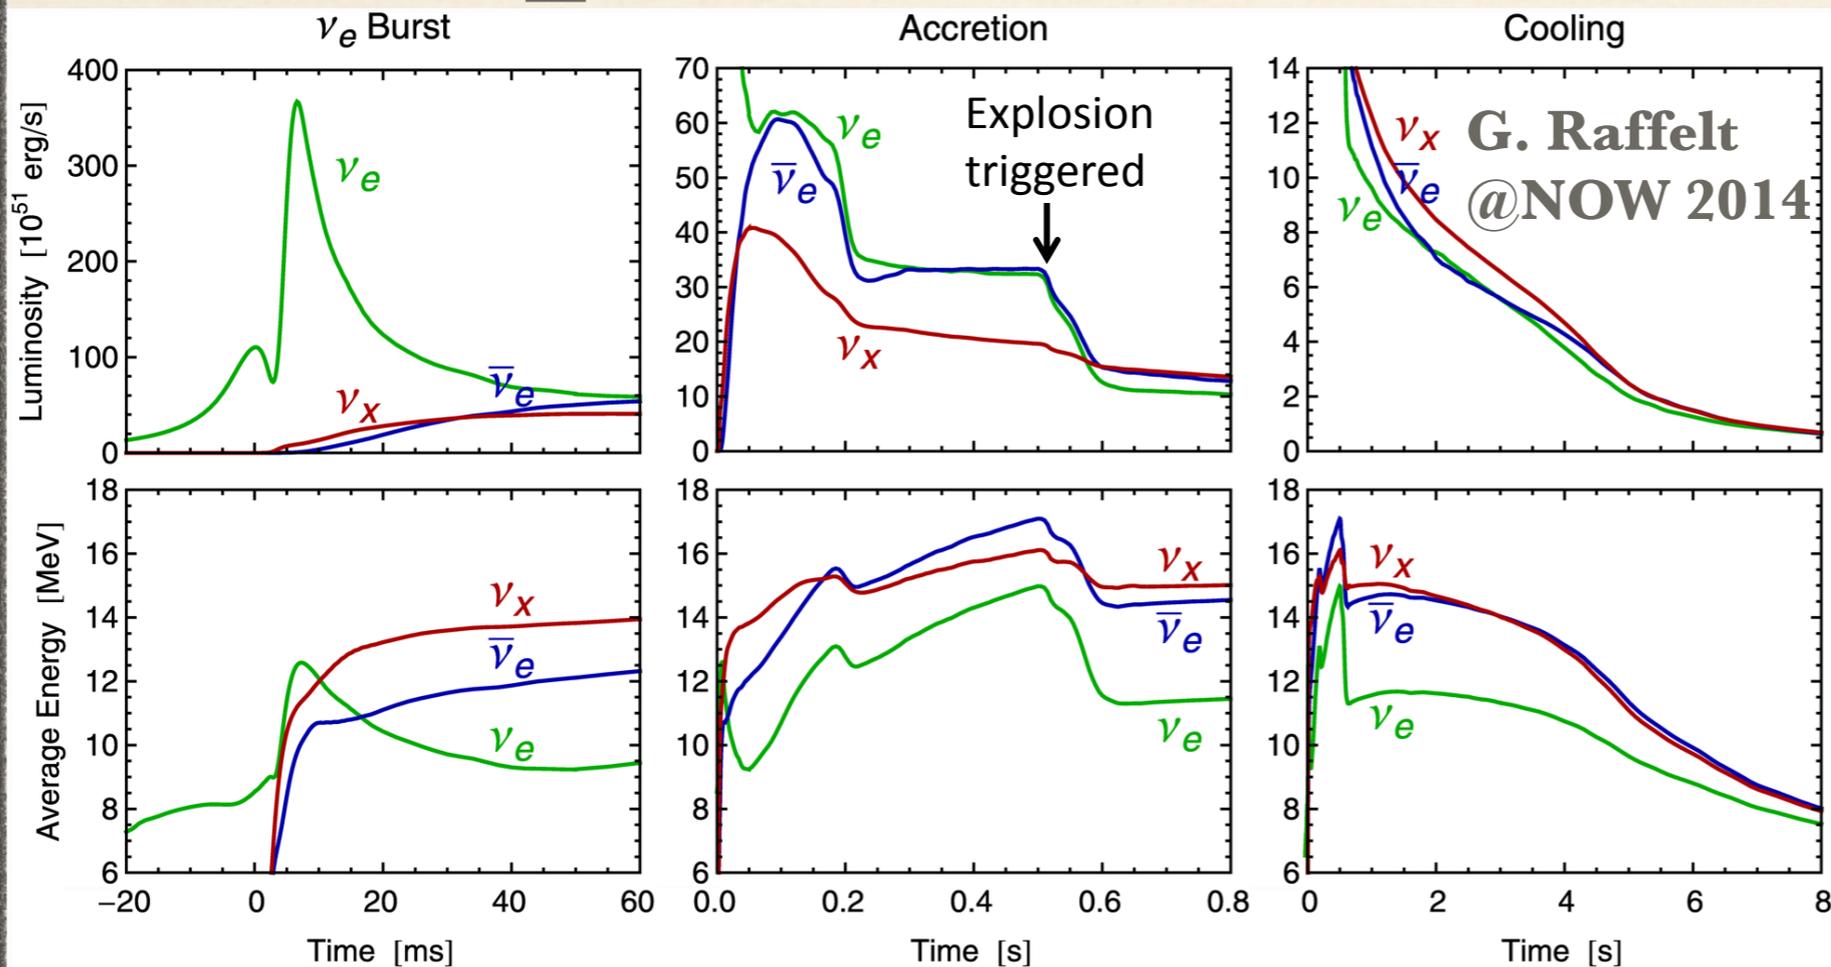

- ❖ simulations: shock rebound stalls after about 600ms
- ❖ stalled shock wave needs energy to start re-expansion against ram pressure of infalling stellar matter
- ❖ neutrinos can supply fresh energy!
- ❖ SASI is 3D “sloshing” of shock wave (=standing accretion shock instability)

Hanke et al., arXiv:1303.6269

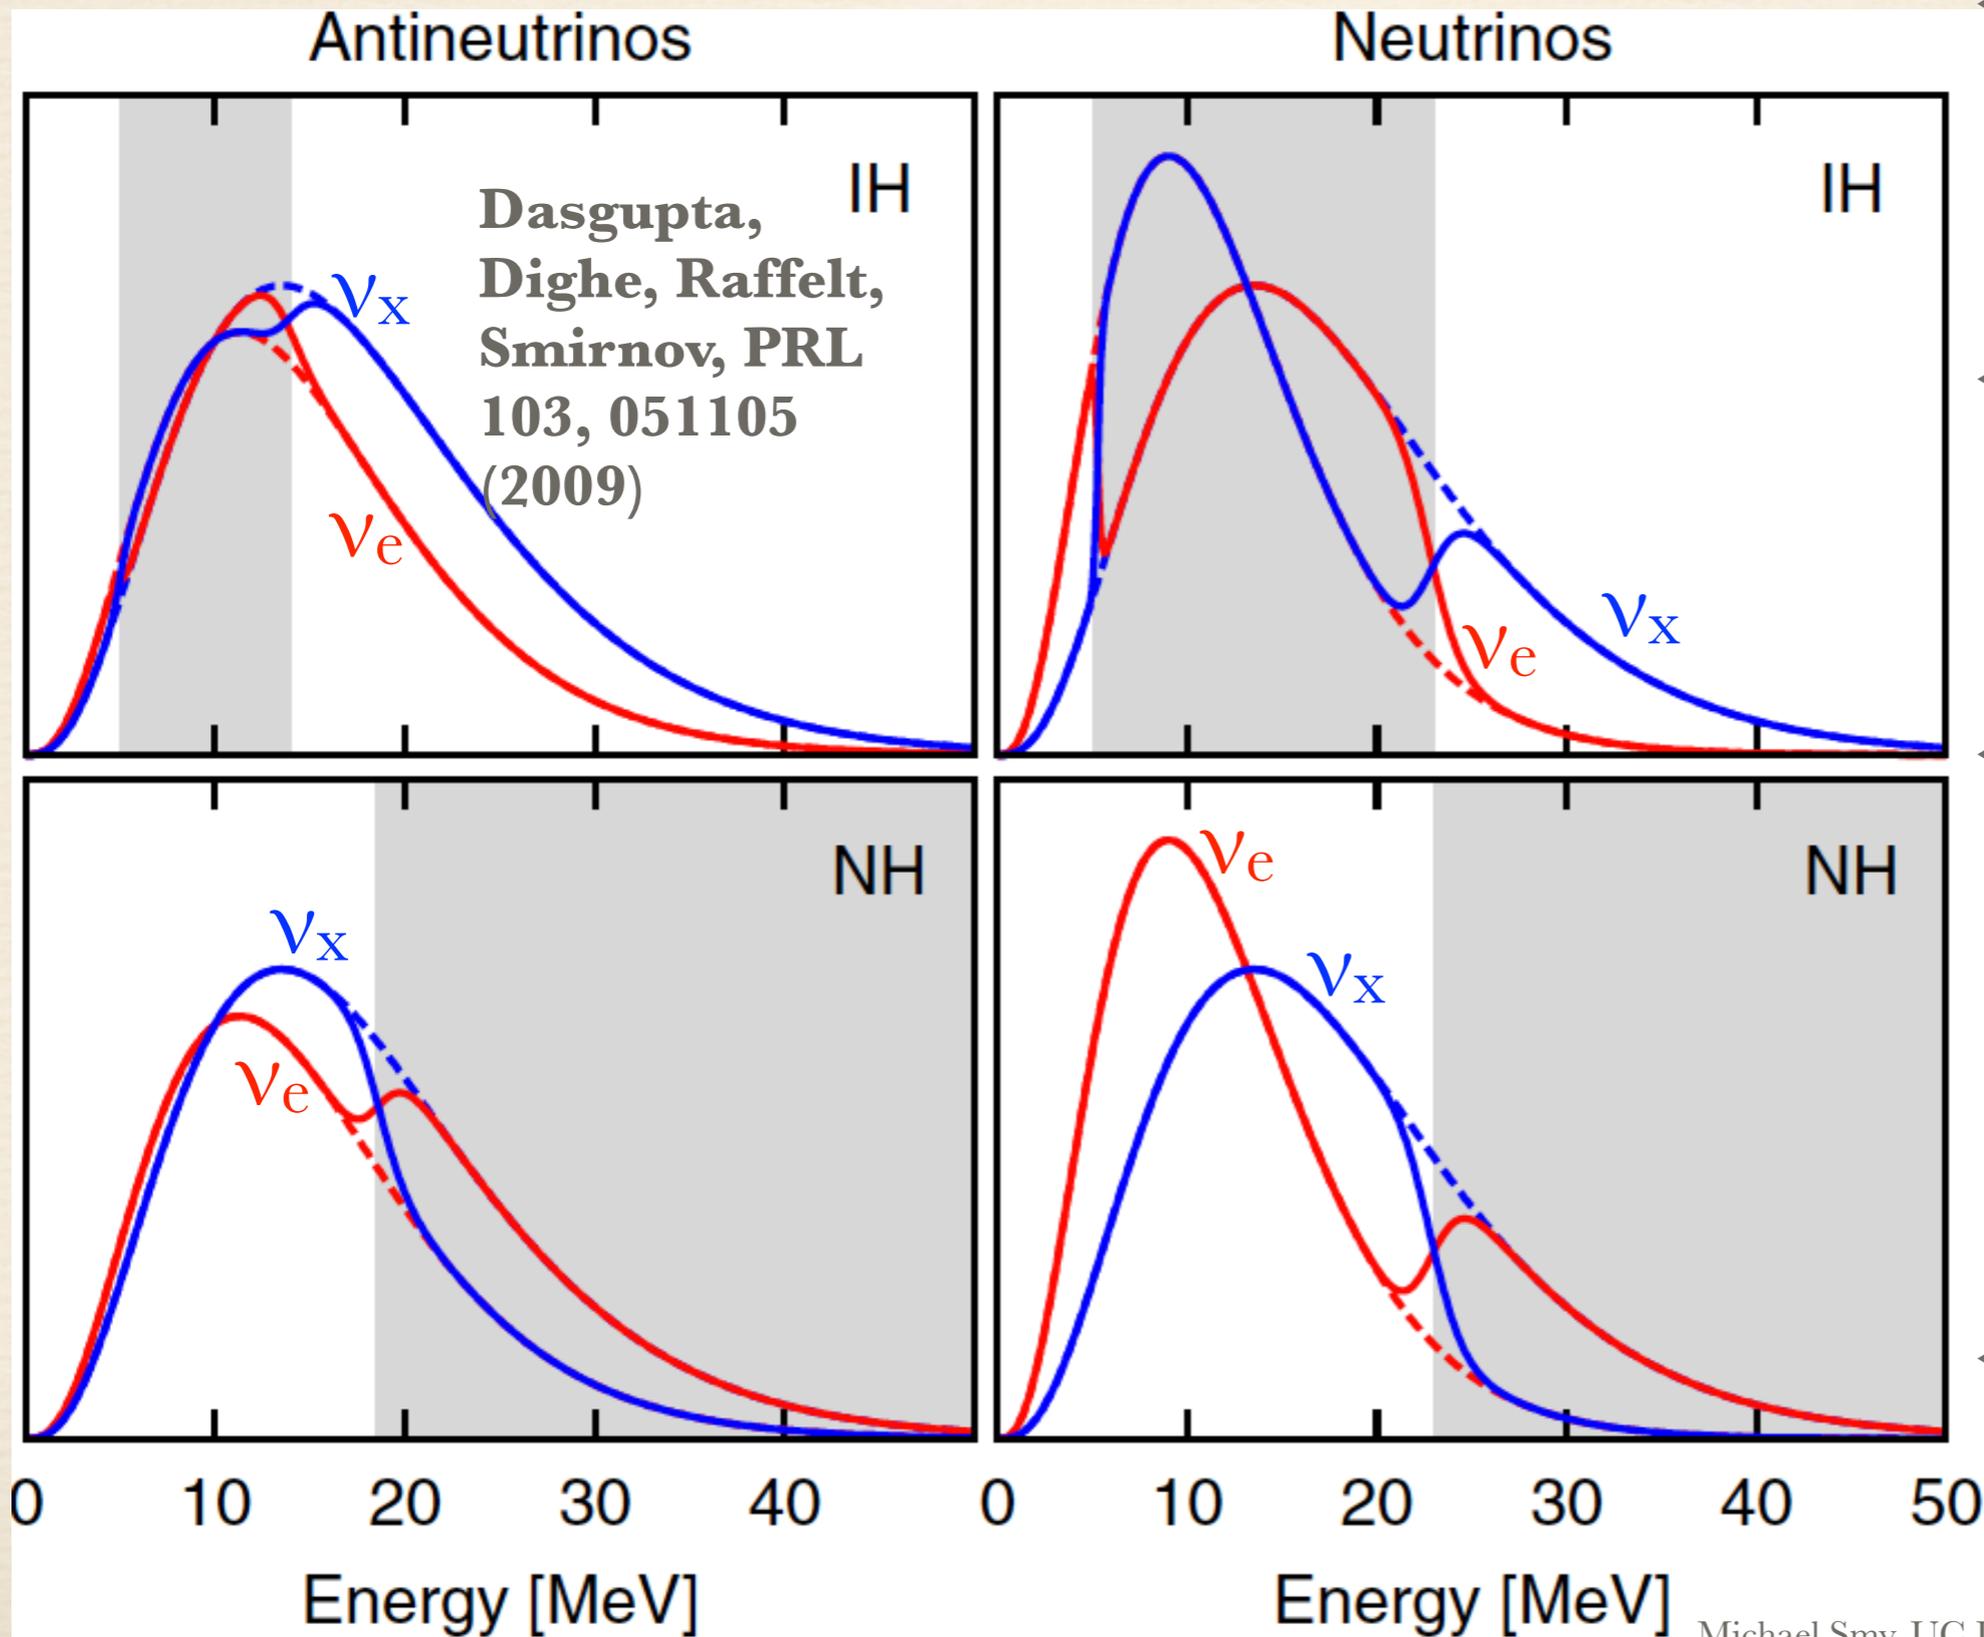

# Supernova $\nu$ Emission

shock breakout; outer shock stalls  $\sim 150\text{km}$ ; in- cooling on neutrino SN  $\nu$  events in Super-K  
 core de-leptonization falling matter powers  $\nu$ 's diffusion time scale

- ❖ water detectors: mostly  $\bar{\nu}_e$ 's; liquid Argon TPCs (DUNE)  $\nu_e$ 's
- ❖ see  $\nu_e$  burst with LArTPC, cooling with water detector
- ❖ develop larger water detectors; enhance with Gd (Hyper-K)

# $\nu$ - $\nu$ Interaction: Only in SN!

- ❖ neutrinos trapped by dense PNS
- ❖  $\nu_x$  escape earlier (at higher T)
- ❖ non-linear  $\nu$  self-interaction “swaps” the spectra
- ❖ depends on mass ordering

# Supernovae in our Backyard

WATCHMAN meeting at  
Virginia Tech in 2013

# Diffuse, Distant SN Flux

- ❖ galactic core collapse supernova neutrinos: a long journey, a long wait!  
(PhD students should finish <50yr)
- ❖ ... so look beyond our galaxy: CC SN rate about 1 Hz!
- ❖ resulting neutrino interaction rate is a few per year in Super-K
- ❖ **observed SN rate** only ~half of **prediction from star formation**
- ❖ a problem with the observation? or the prediction? neutrinos would tell!

# Super-K's Diffuse, Distant SN $\nu$ Search Using IBD: $\bar{\nu}_e + p \rightarrow e^+ + n$

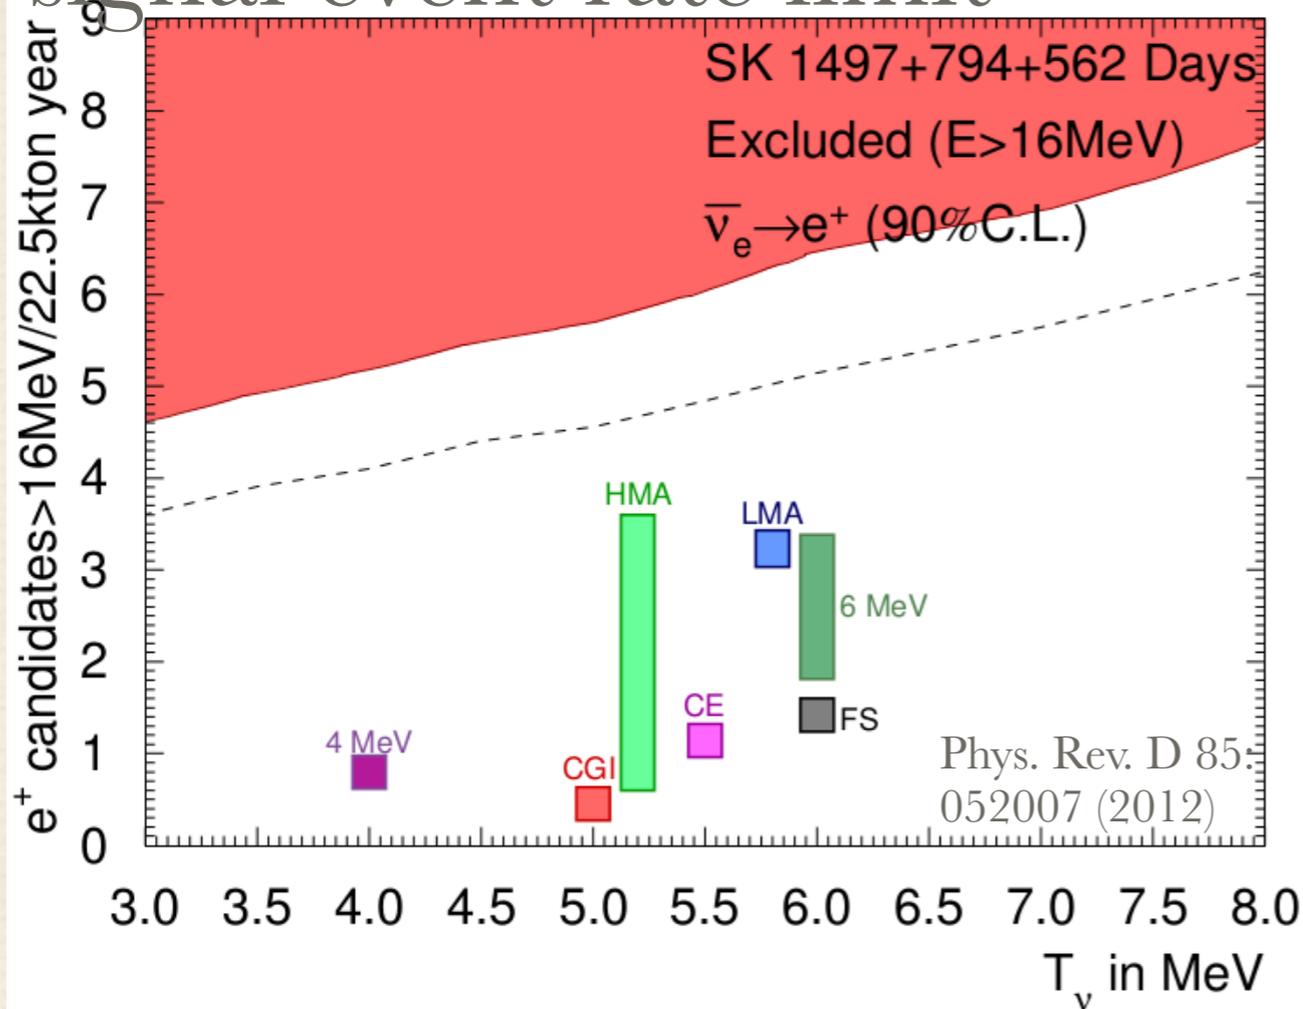

- ❖ PhD thesis of Kirk Bays (now at CalTech working on Nova)
- ❖ analysis has backgrounds from atmospheric  $\nu$  interactions
- ❖ world's best sensitivity for distant supernova  $\nu$ 's

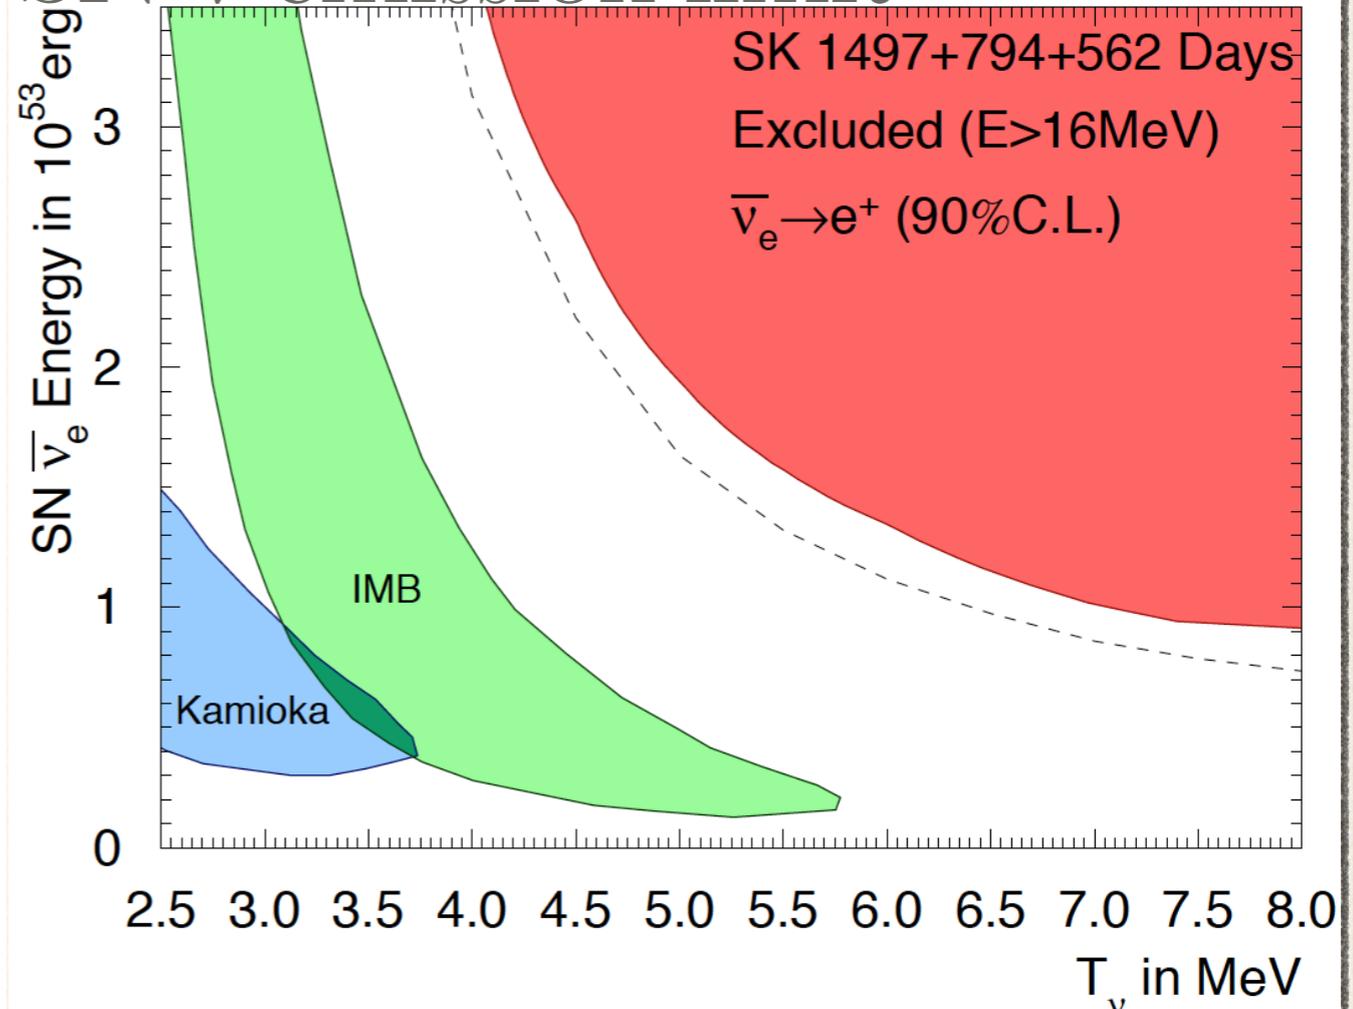

- ❖ SK-I:  $-0.3 \pm 2.3/\text{yr}$ , (1497d)
- ❖ SK-II:  $4 \pm 6.5/\text{yr}$ , (794d)
- ❖ SK-III:  $7 \pm 5/\text{yr}$ , (562d)
- ❖ SK I-III:  $2 \pm 2$  events/yr
- ❖ SK IV:  $\sim 2860$  days of data

# Super-K's Diffuse, Distant SN Search

signal event rate limit

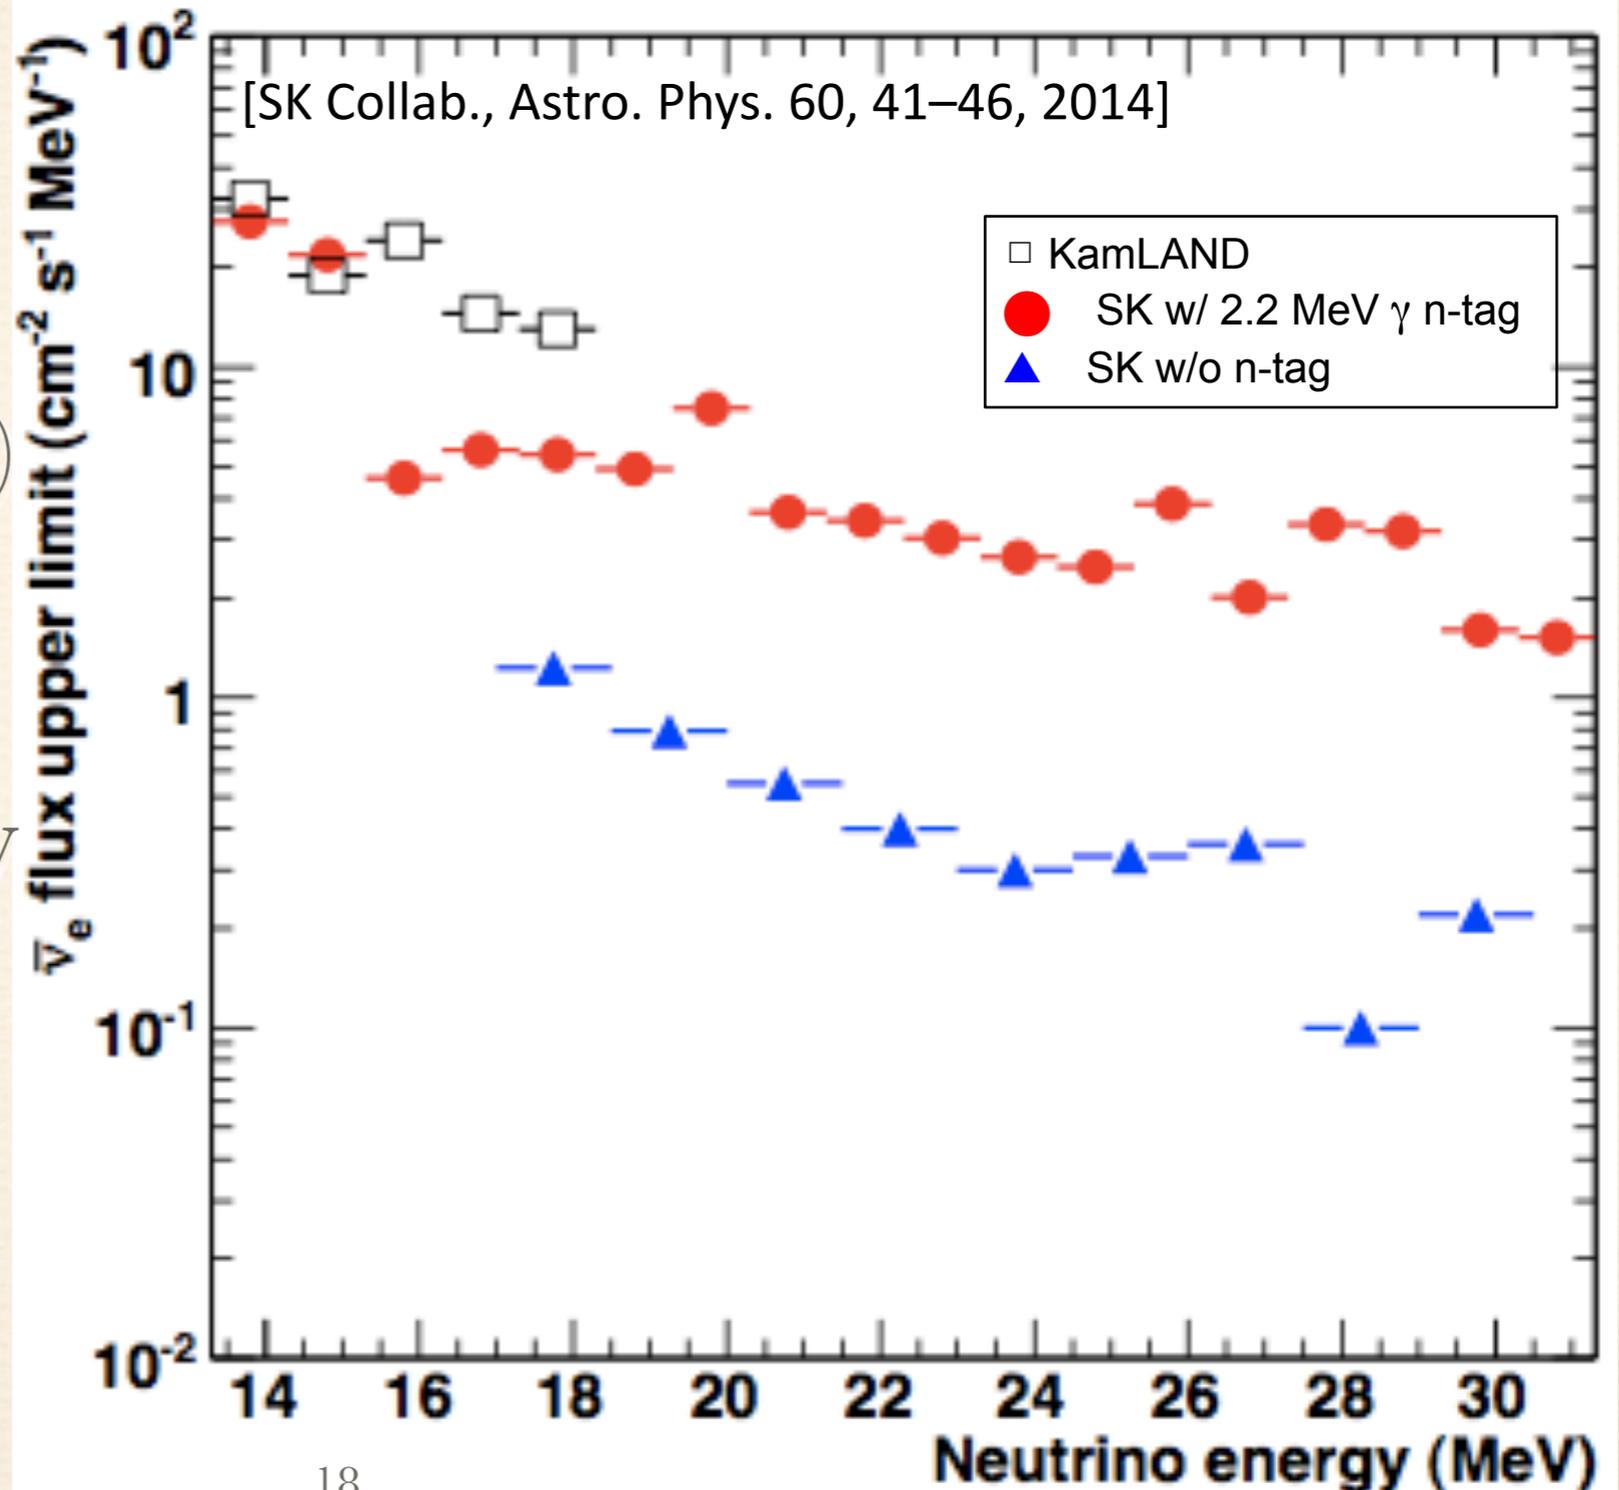

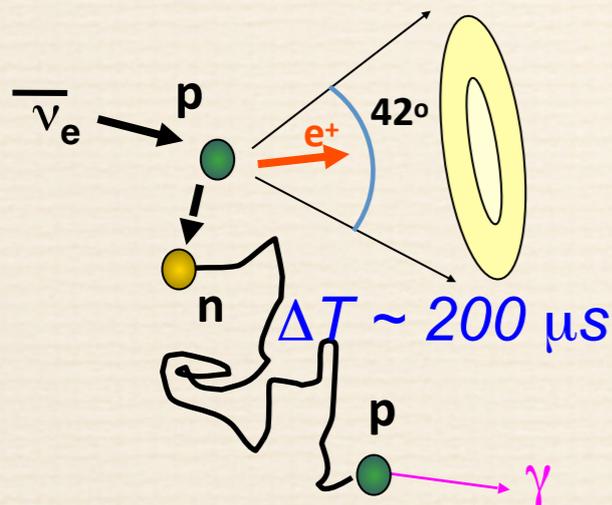

SN  $\nu$  emission limit

- ❖ event rate limits are close to theoretical predictions
- ❖ neutrino emission limits are close to expectations based on SN 1987a
- ❖ must reduce background for discovery!

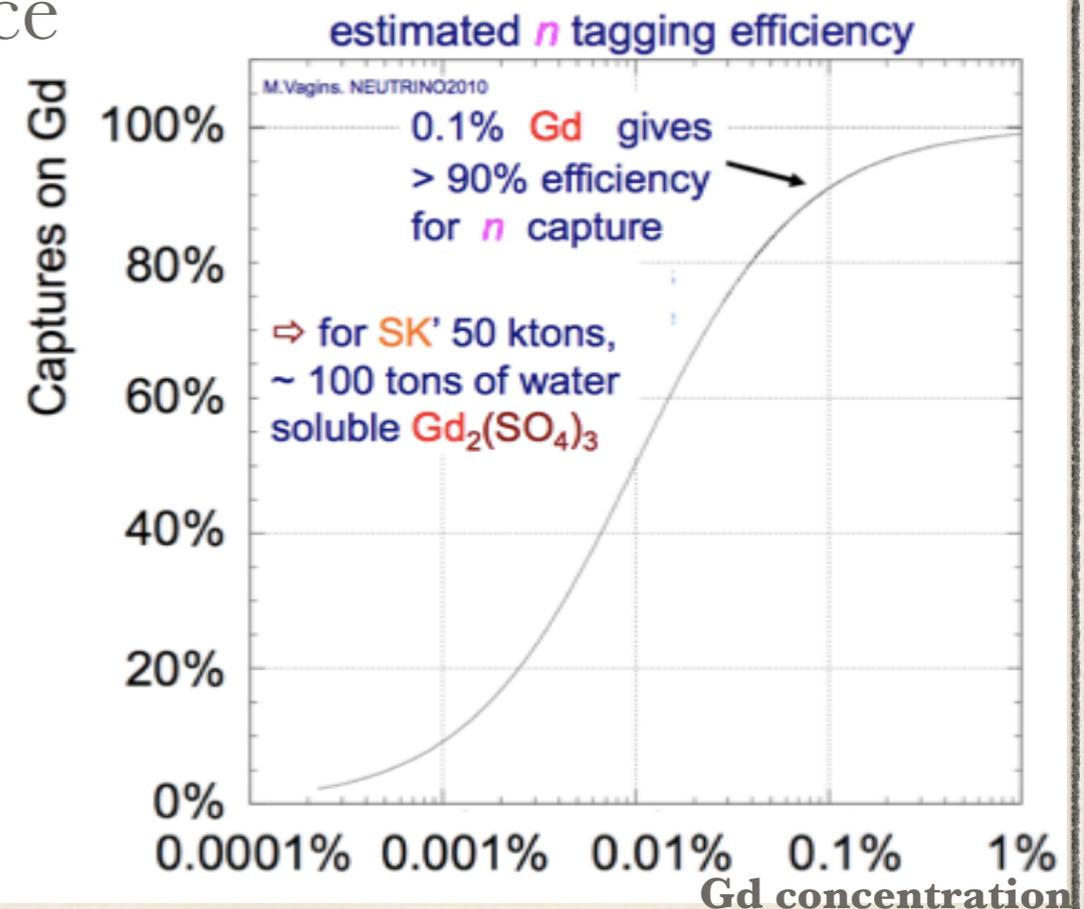

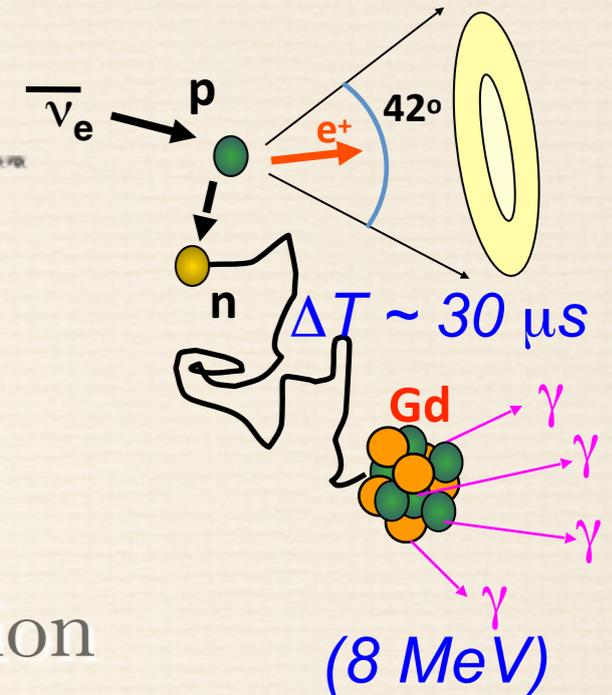

# Detect IBD Neutron by 2.2 MeV $\gamma$

- ❖  $n+p \rightarrow d+\gamma$
- ❖ efficiency only 10-15% (recently improved to  $\sim 20\%$ )
- ❖ limit gets worse due to poor tagging efficiency

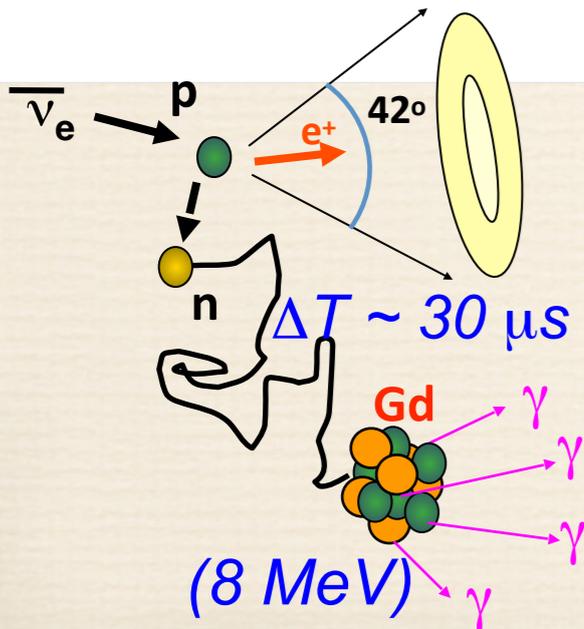

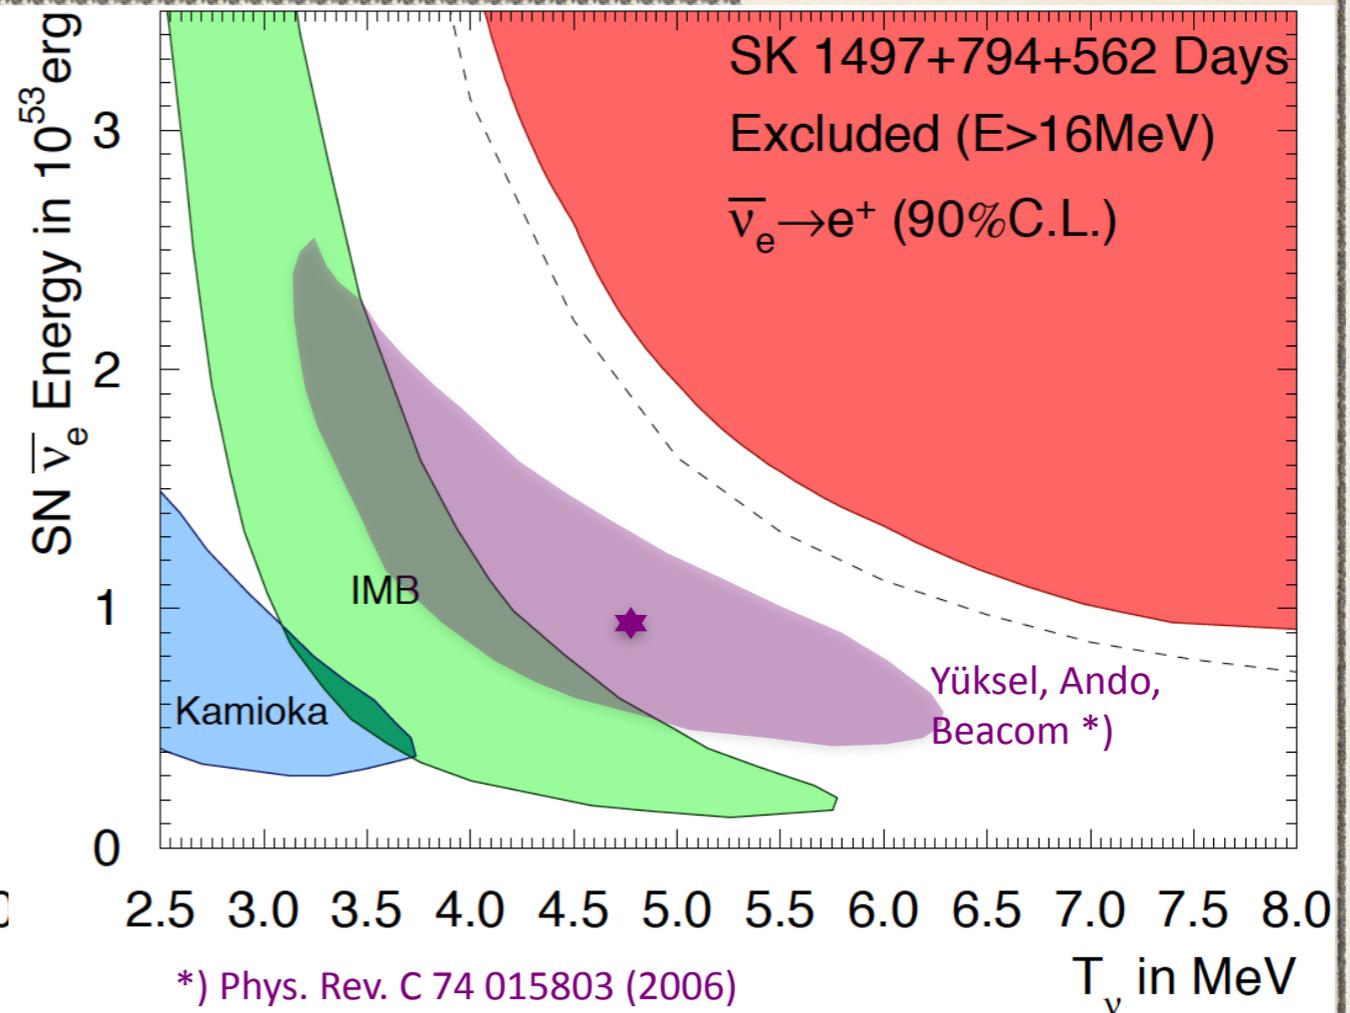

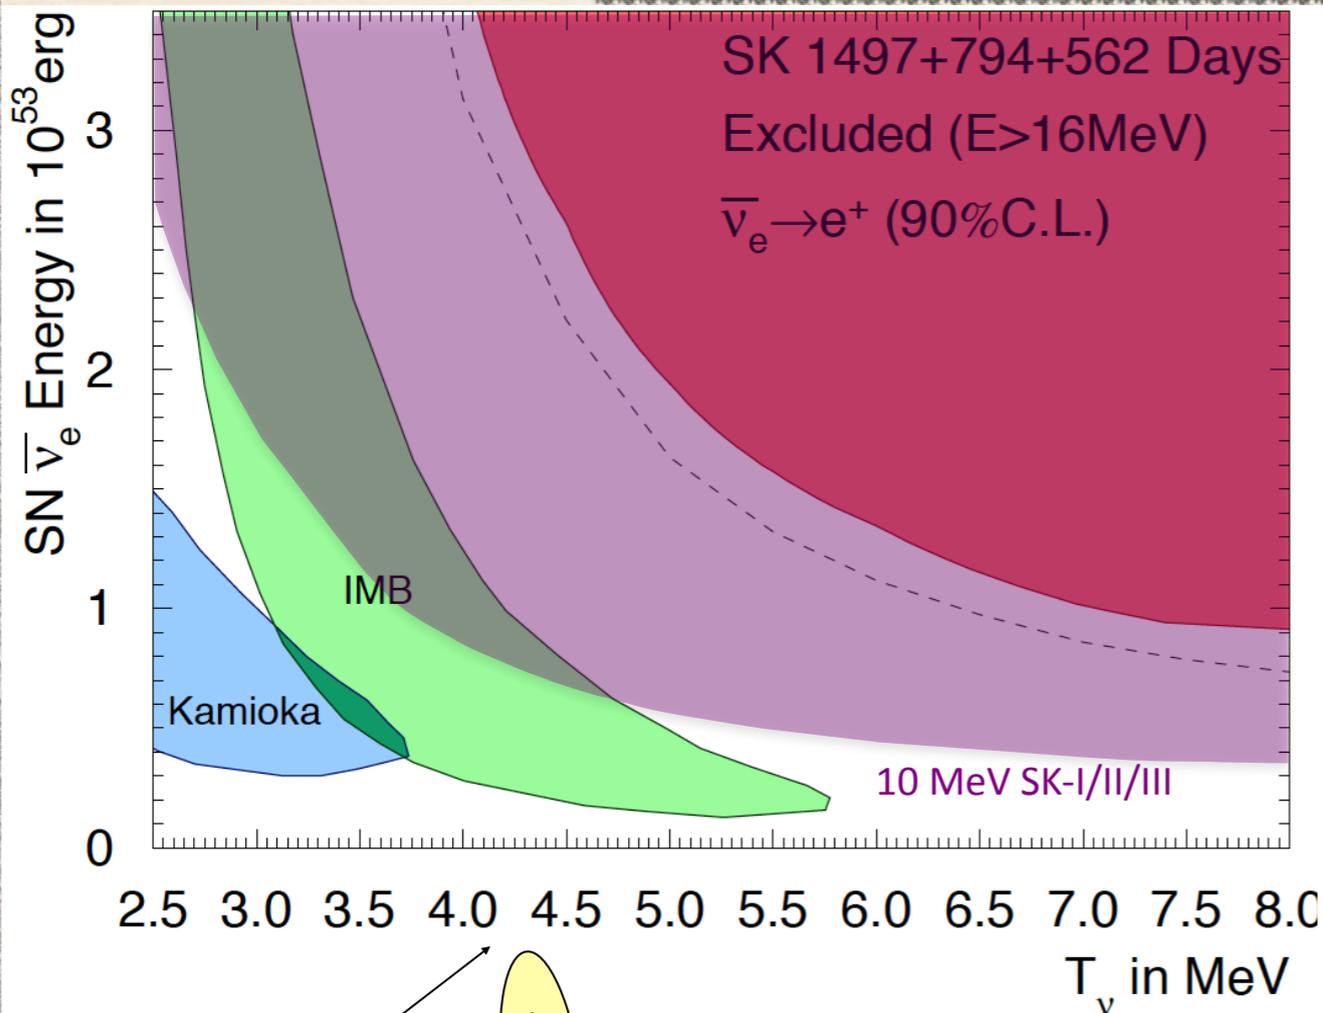

# Detect Neutron from IBD with Gd

- ❖ idea from **J. Beacom and M. Vagins**: dissolve 0.1% Gd ions to capture neutrons (GADZOOKS!)  
*Phys. Rev. Lett., 93:171101, 2004*
- ❖ idea studied and developed at UCI
- ❖ giant cross section (49000barn): tighter time correlation (30  $\mu$ sec), higher multiplicity (3-4  $\gamma$ 's), higher energy (8 MeV): more distinct signature! (reduce accidental coincidences by  $>100$ )
- ❖ use  $\text{Gd}_2(\text{SO}_4)_3$  for
  - ❖ small light attenuation
  - ❖ compatibility with Super-K detector (not corrosive)
  - ❖ high solubility

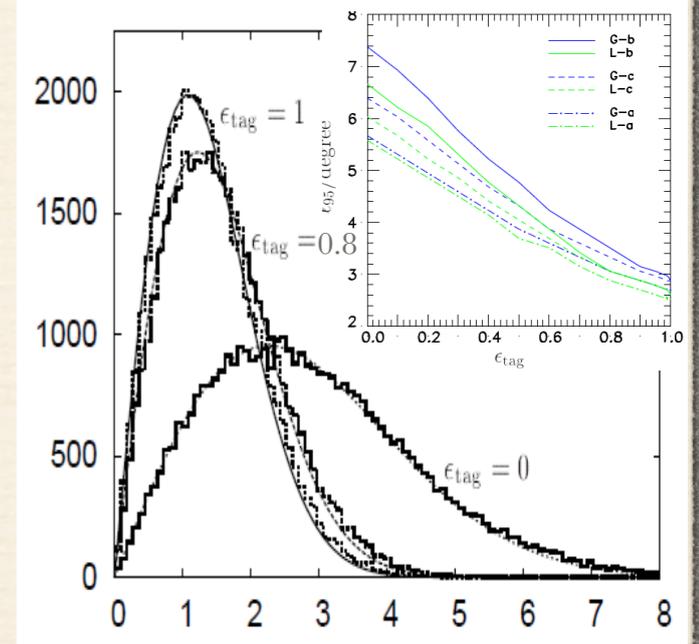

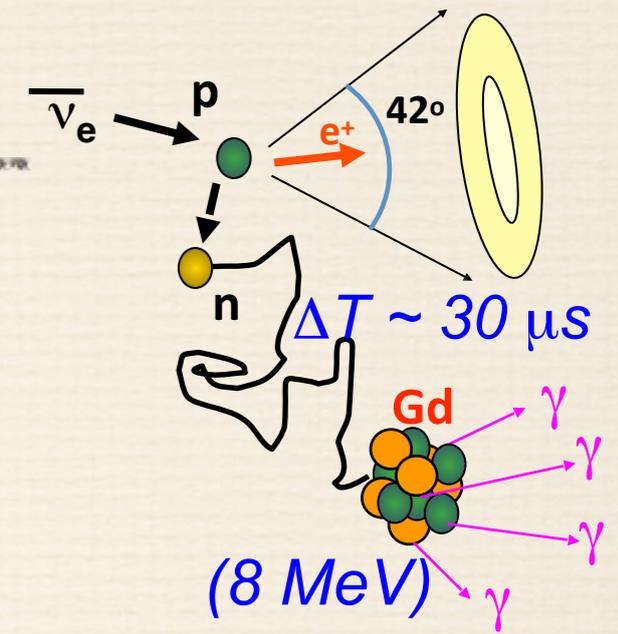

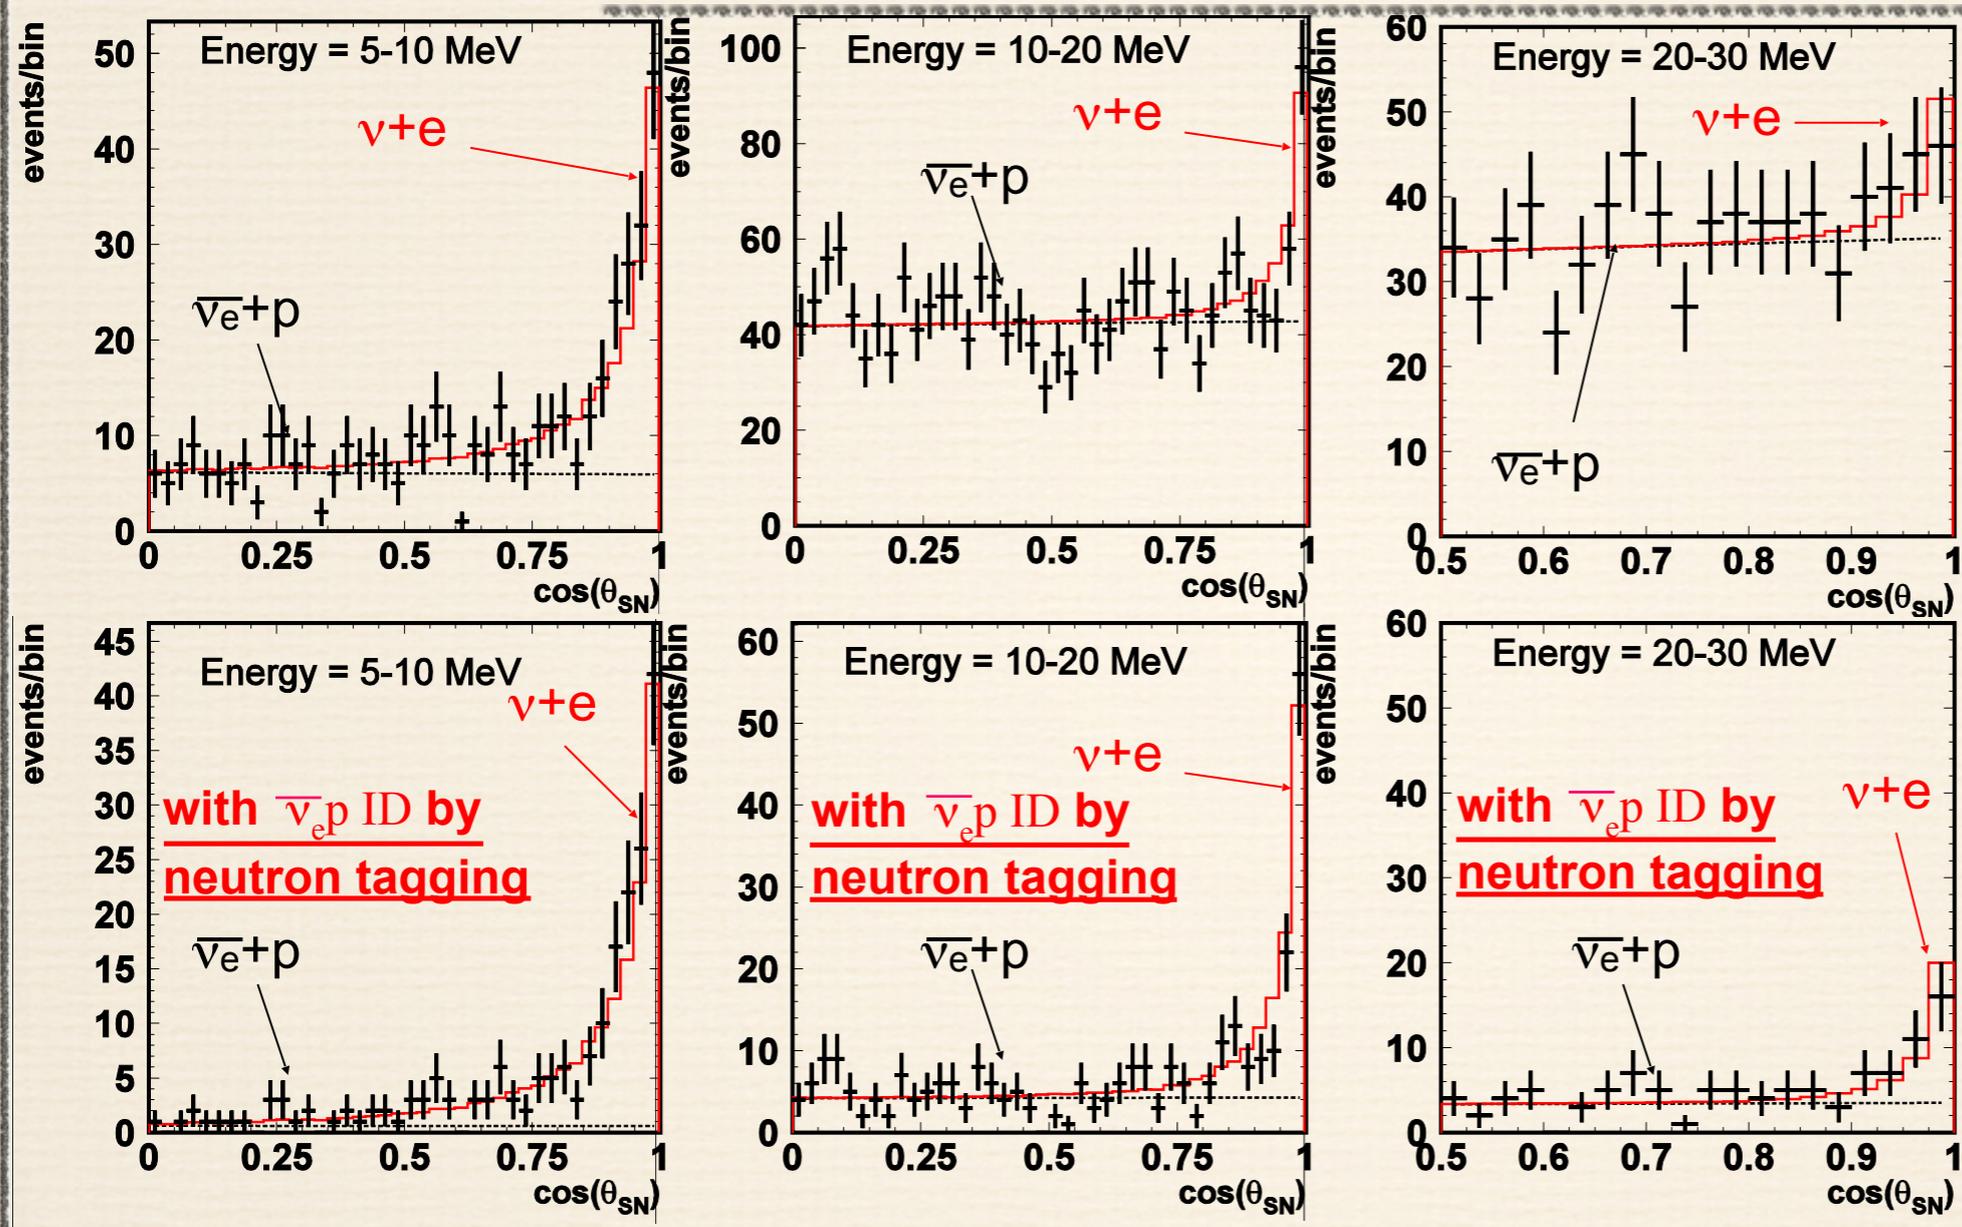

# IBD with Gd-n Tag: Sensitivity Estimates

- ❖ gain sensitivity from lower threshold!
- ❖ discovery, if best models are correct!
- ❖ exclude wide range of models, if no signal

# Flavor Decomposition and Pointing with n Tagging

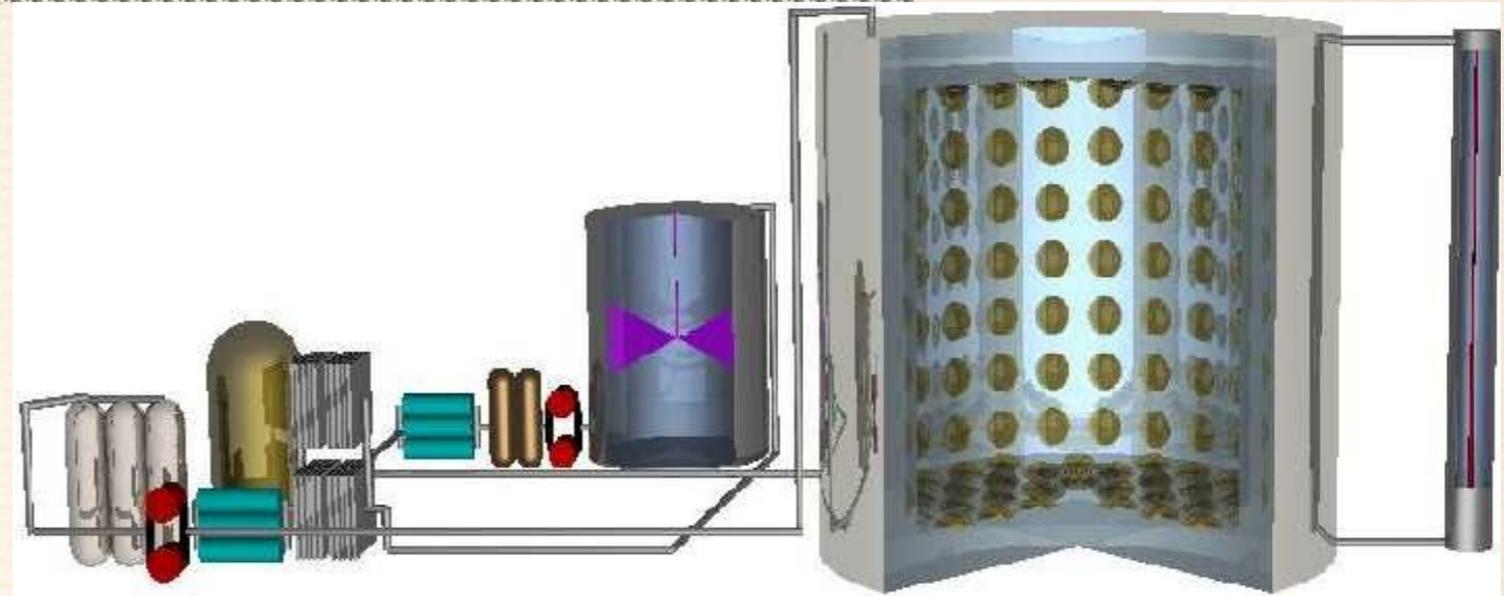

Thomas, Sekikoz, Raffelt, Kachelriess, Dighe hep-ph/0307050v2

- ❖ improve ES signal and flavor decomposition of galactic SN  $\nu$  burst
- ❖ improve angular resolution by factor of two!

# EGADS

- ❖ 200t test detector
- ❖ proof of principle
- ❖ check compatibility
- ❖ check light attenuation
- ❖ measure Gd concentration
- ❖ develop Gd solution and removal technology
- ❖ develop calibration techniques

# Just Tank: Smooth Behavior as Gd is Added

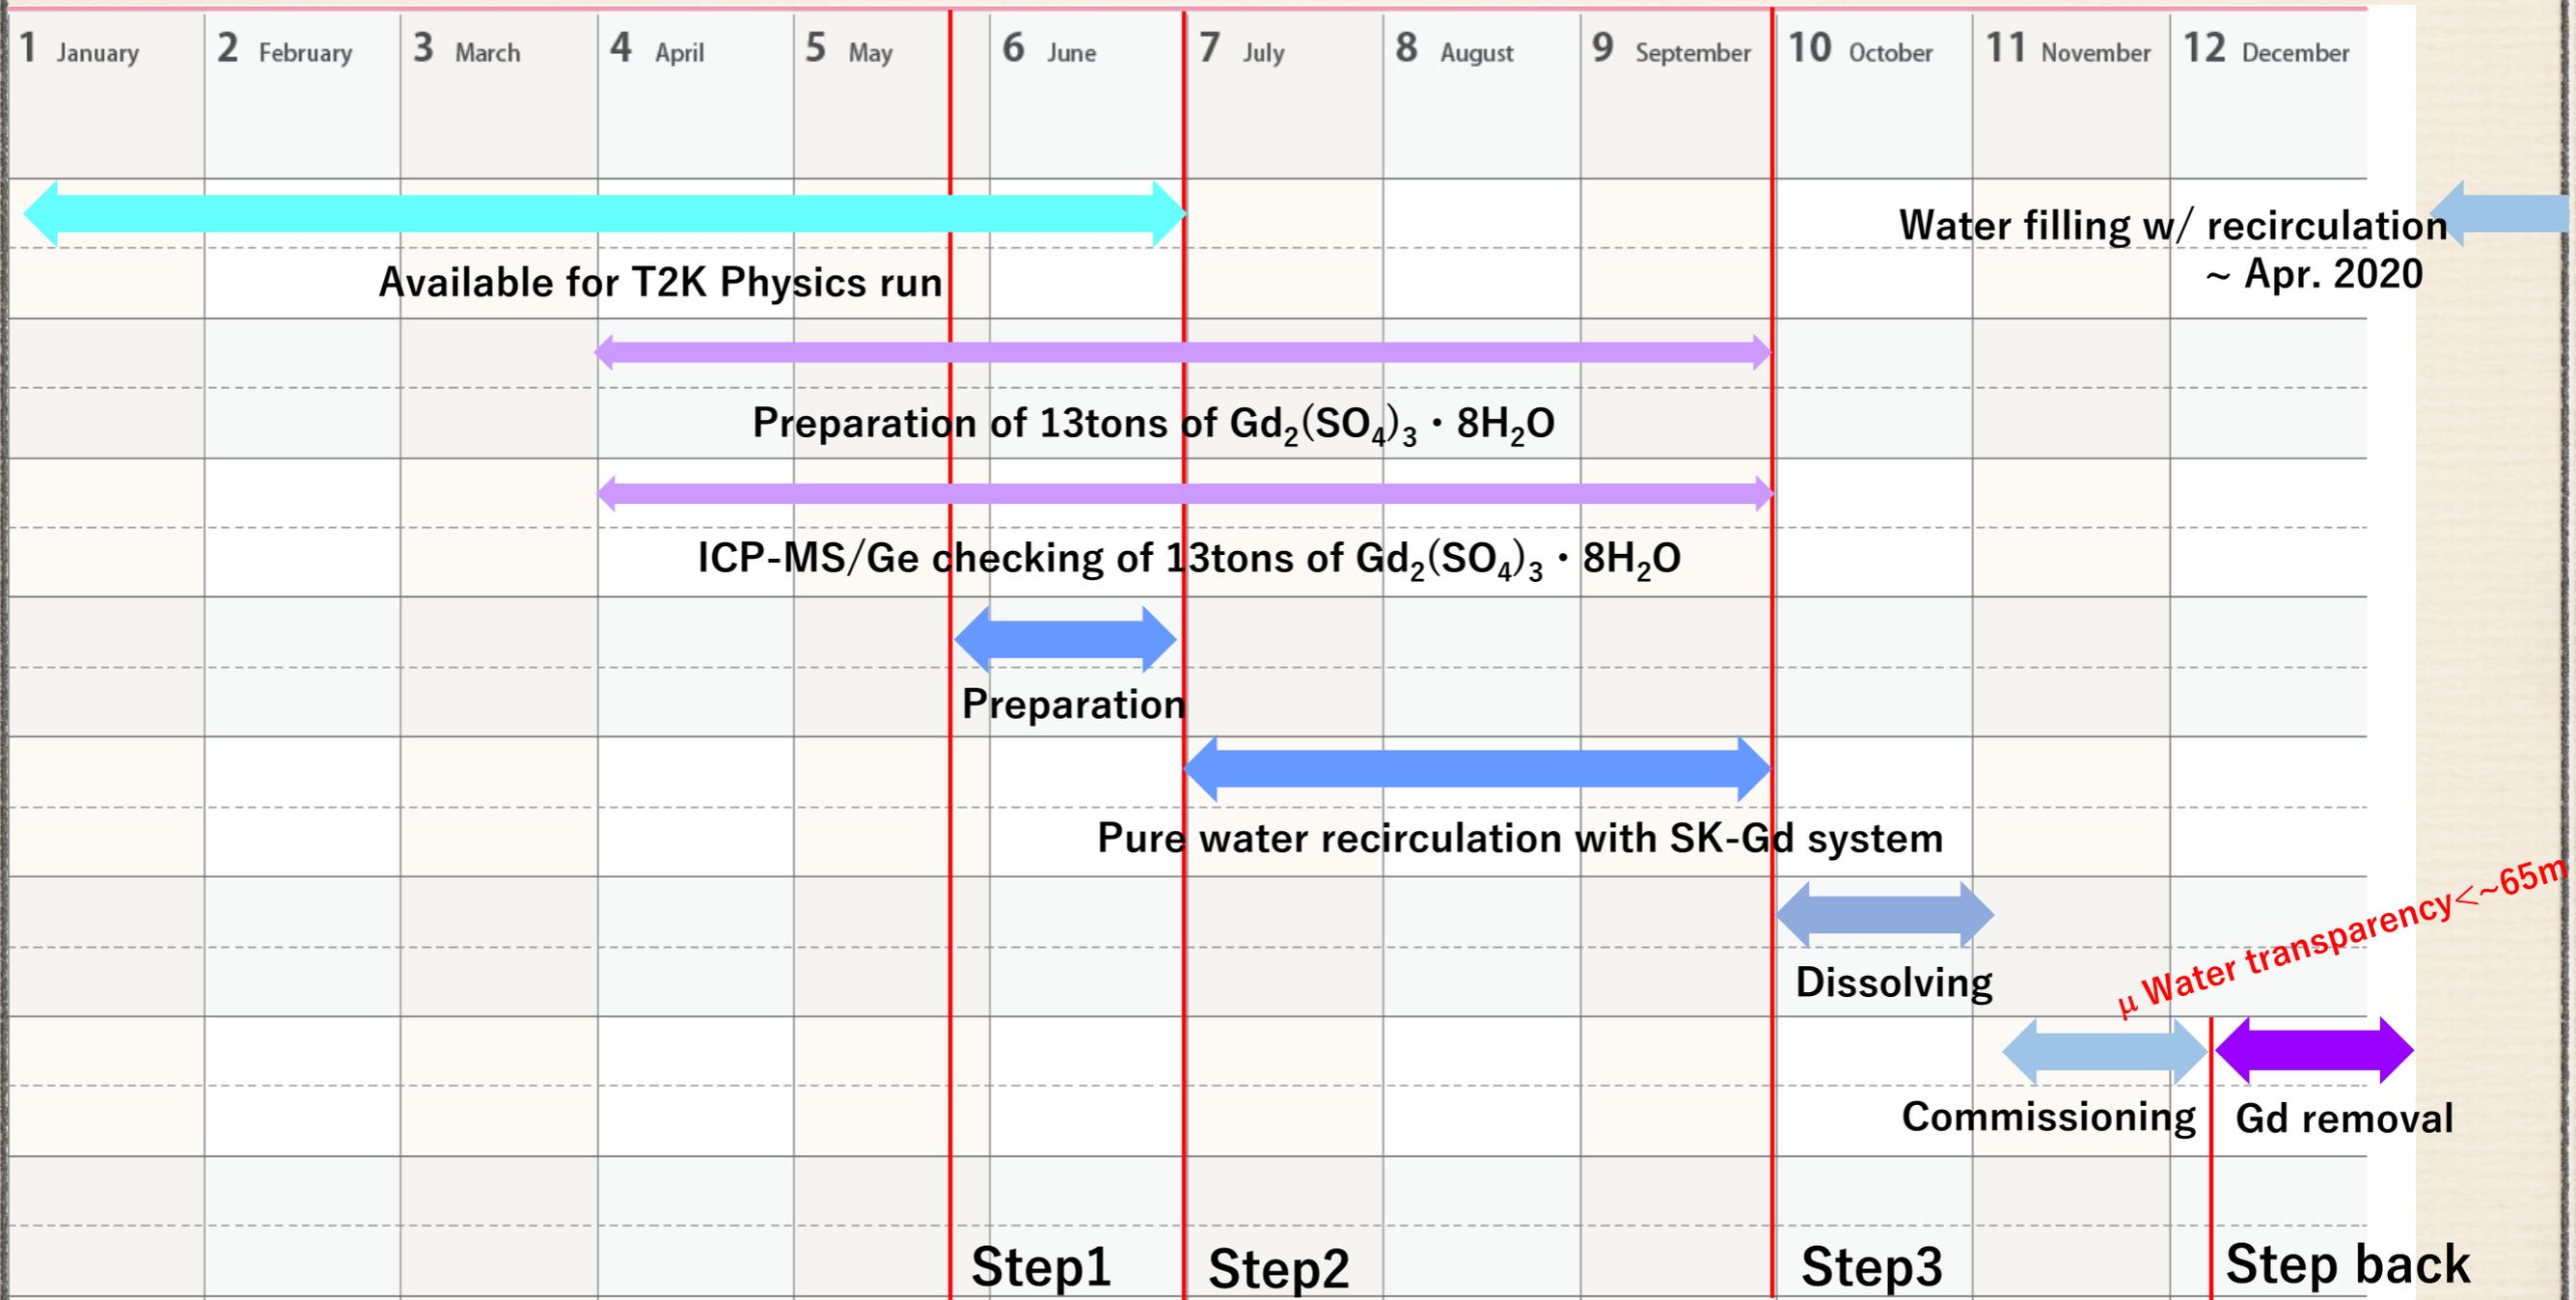

# Schedule to add $\text{Gd}_2(\text{SO}_4)_3$

---

- ❖ June 2018-September 2018: prepare Super-K for Gd phase
  - ❖ replace dead PMTs
  - ❖ add pipes for better water flow control of inner and outer detector
  - ❖ the tank leaks: seal possible places where leak might occur
- ❖ 2019: start dissolving 13 tons of  $\text{Gd}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ 
  - ❖ agreed plan of Super-K collaboration
  - ❖ subject to approval by other stake holders, in particular T2K

# Schedule to add $Gd_2(SO_4)_3$

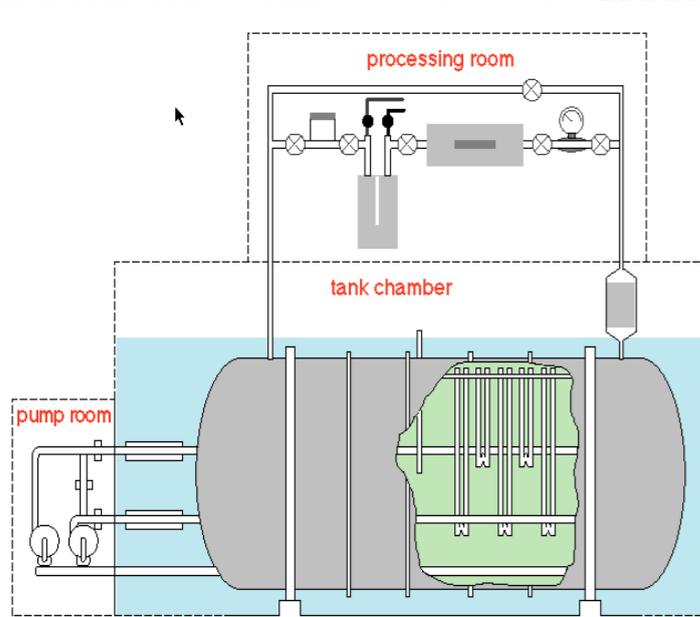

# Solar Neutrinos

---

- ❖ nuclear physics/astrophysics
  - ❖ sun shines via nuclear fusion
  - ❖ solar core temperature and stability
  - ❖ test (evolutionary) solar models (and some of the assumptions)
- ❖ particle physics:
  - ❖ neutrino “oscillations” (periodic change of neutrino type): solar neutrino data started this idea
  - ❖ “flavor” transformation: test Mikheyev-Smirnov-Wolfenstein effect (compare low and high energy solar neutrinos)
  - ❖ directly test matter effects on neutrino oscillations (in the earth) by comparing day- and night-time interaction rates
  - ❖ neutrino magnetic moment

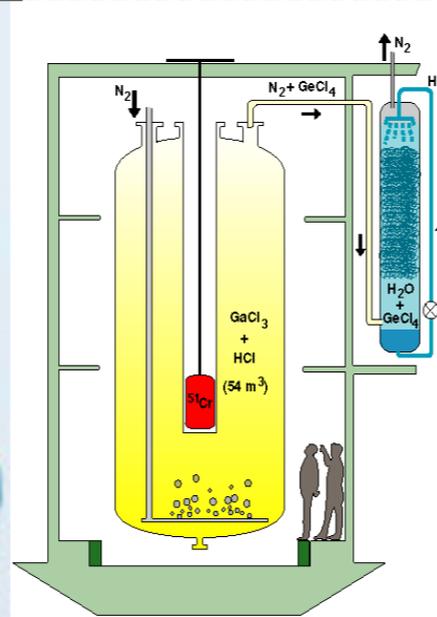

# Other Solar Neutrino Experiments

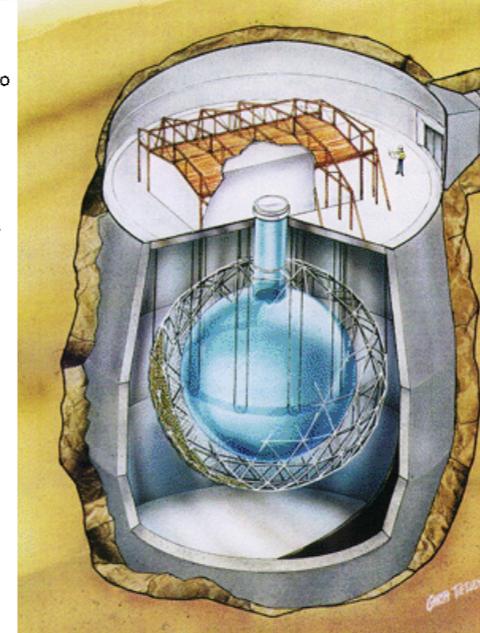

Homestake (Cl)

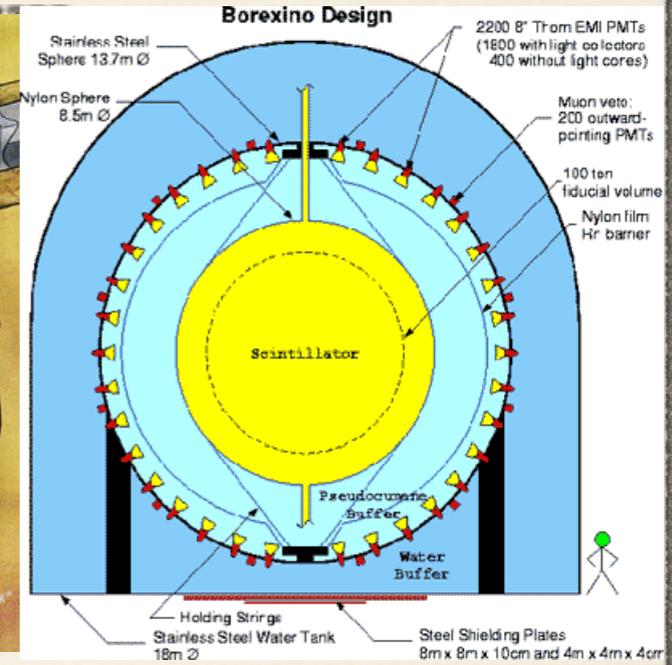

SAGE (Ga)

GALLEX (Ga)

SNO (D<sub>2</sub>O)

BOREXINO (Scint.)

- ❖  $\text{Cl} \rightarrow \text{Ar}$  ( $>800\text{keV}$ ) and  $\text{Ga} \rightarrow \text{Ge}$  ( $>200\text{keV}$ ) when  $\nu_e \rightarrow e^-$ : count Ar/Ge atoms! (radiochemical detection)
- ❖ water-Cherenkov ( $>\text{few MeV}$ )  $e^-$  elastic scattering (all active  $\nu$ ),  $d \rightarrow p+p$  when  $\nu_e \rightarrow e^-$  and  $d \rightarrow p+n$  (all active  $\nu$ )
- ❖ scintillator ( $>\text{few } 100 \text{ keV}$ )  $e^-$  elastic scattering (all active  $\nu$ )

# Solar Model and Solar $\nu$ Data

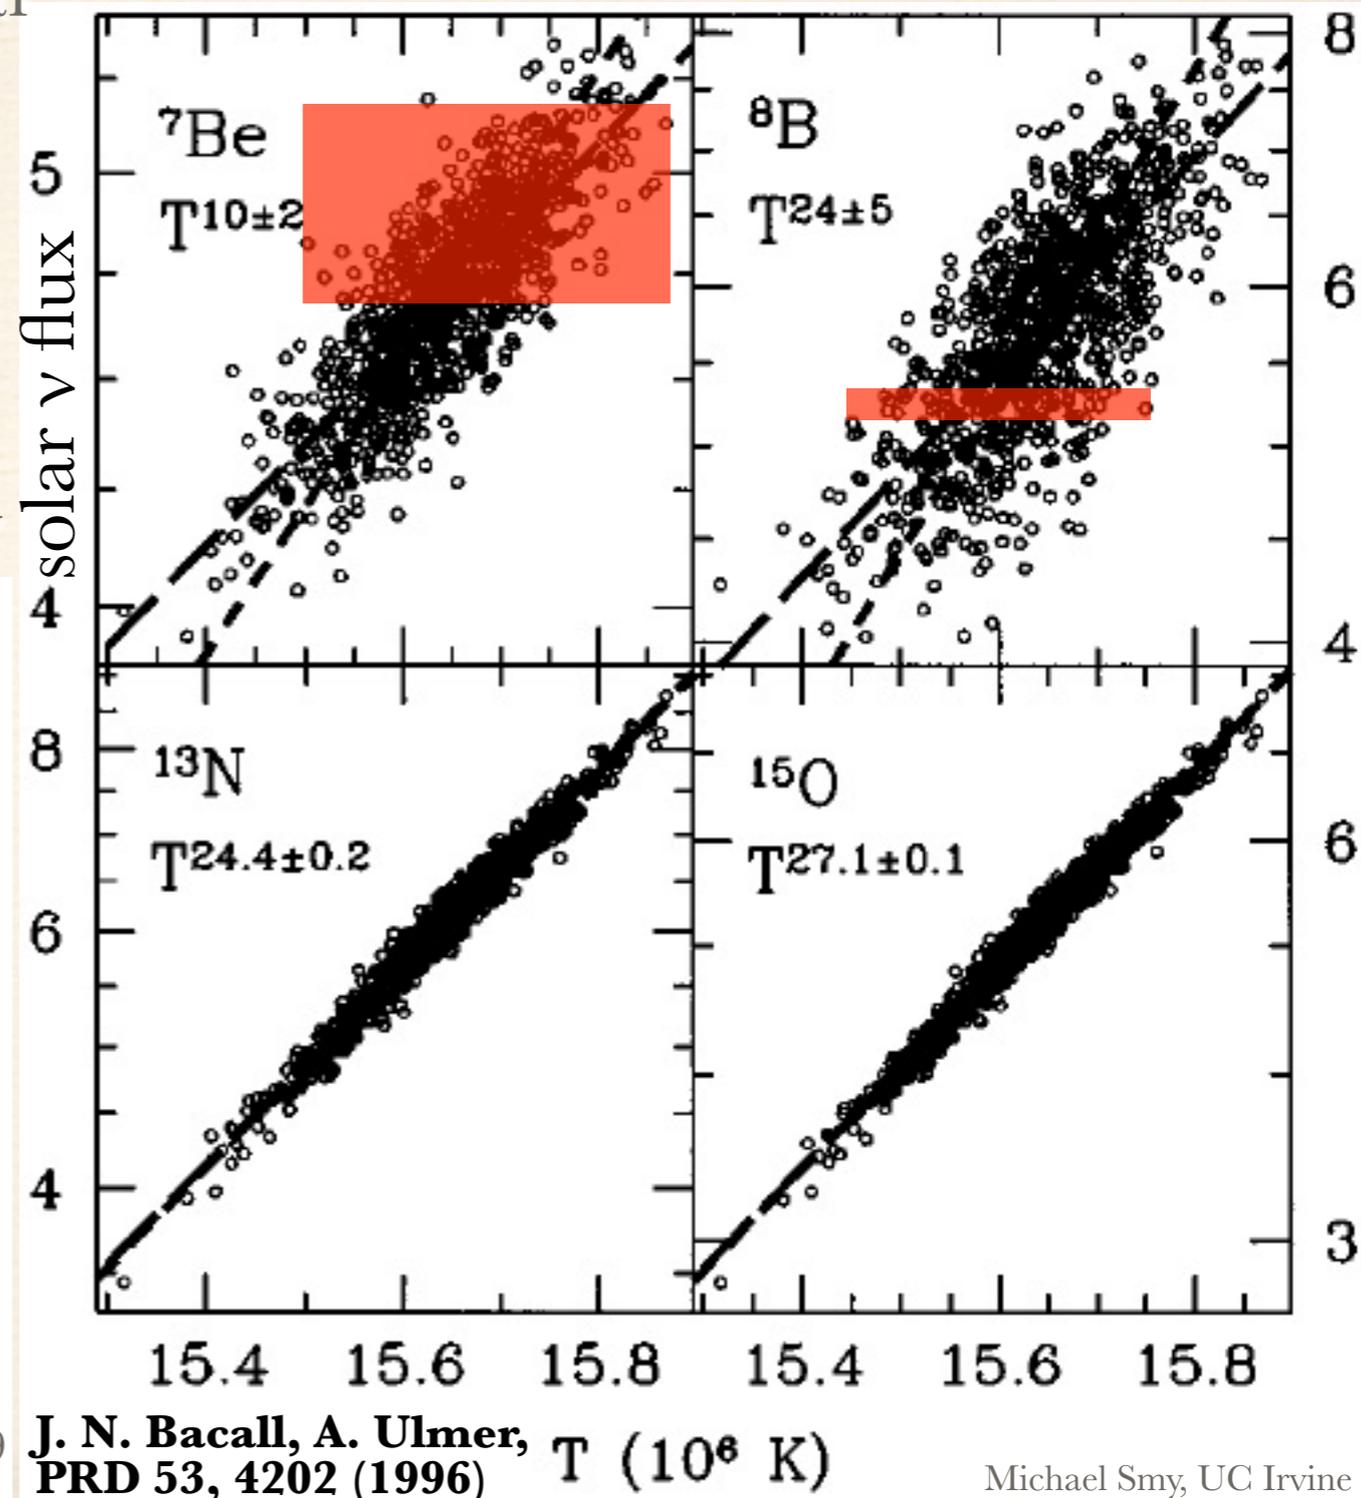

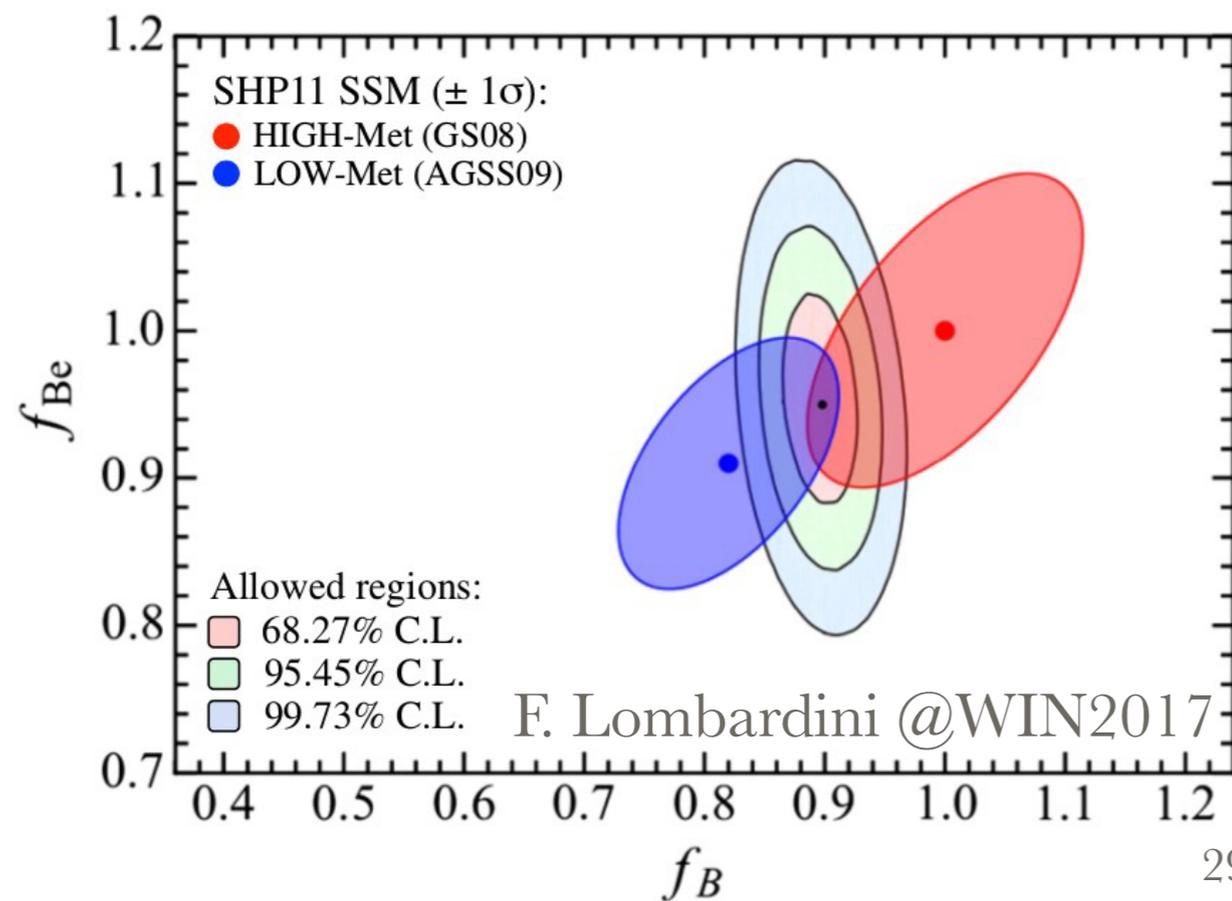

Raymond Davis, Jr

- ❖ solar  $\nu$  detection: evidence for nuclear fusion
- ❖  $^8\text{B}$  solar  $\nu$ 's: measure of core temperature
- ❖ today: two (evolutionary) solar models based on different element abundance data: Grevesse & Sauval (1998; GS98) and Asplund et al. (2009; AGSS09)
- ❖ newer AGSS09 doesn't fit as well with helio-seismology data
- ❖ AGSS09 reduces CNO flux by  $\sim 30\%$
- ❖ changes opacity and core temperature

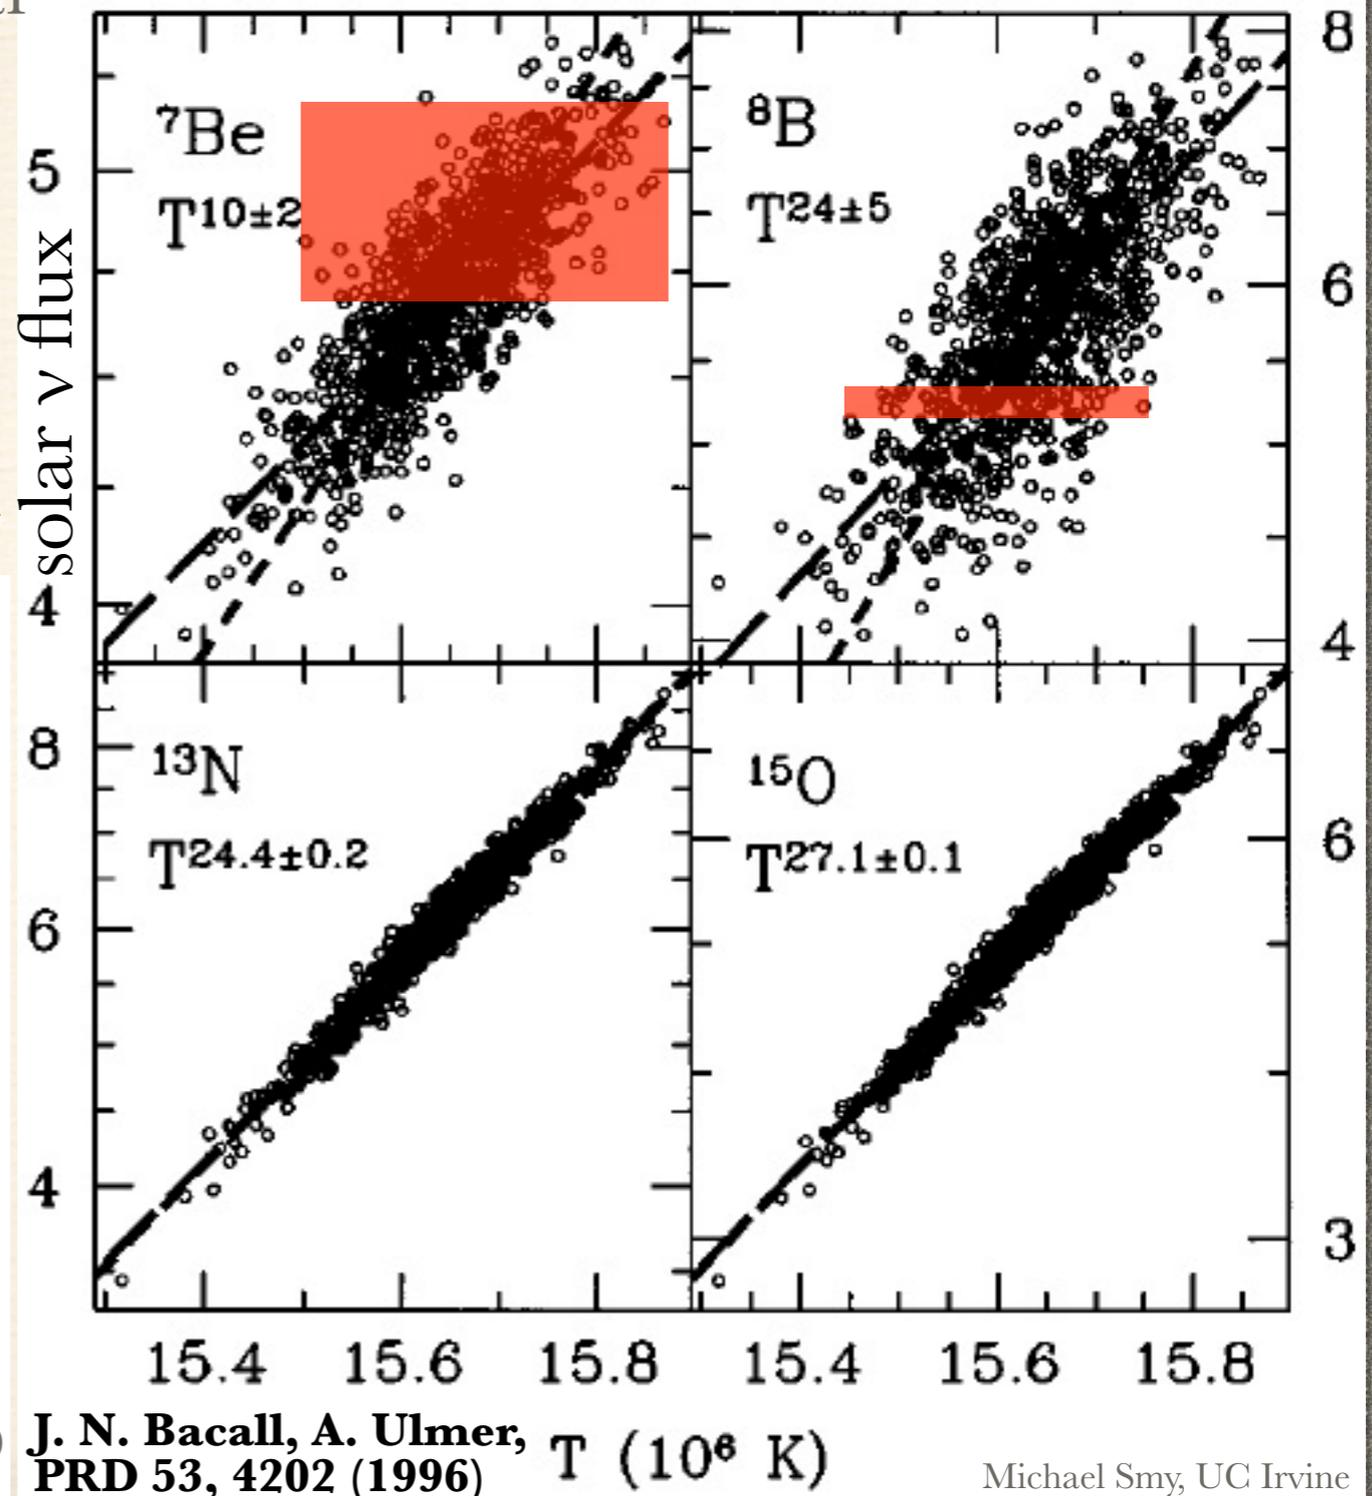

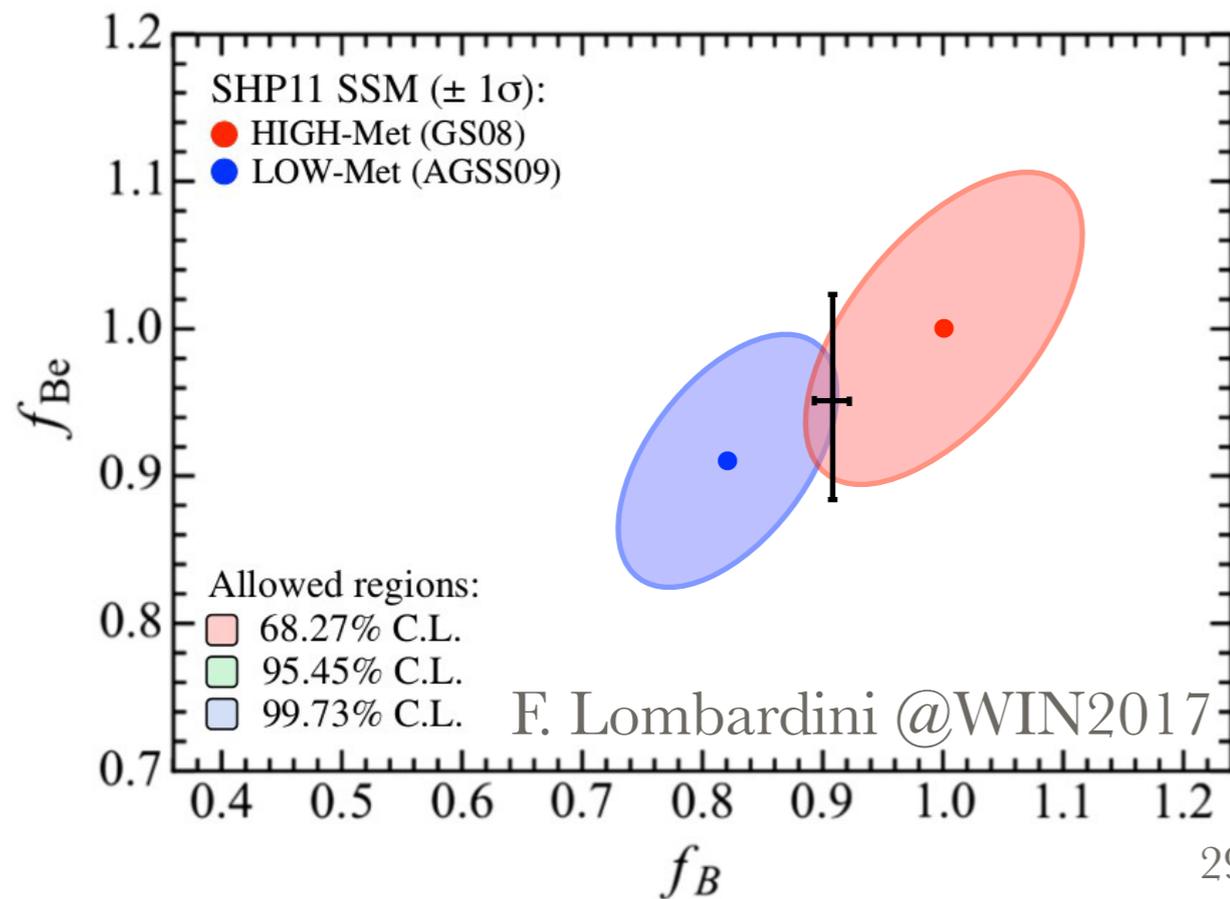

# Solar ${}^8\text{B}$ $\nu$ 's and Solar Models

- ❖ measure value and stability) of solar core temperature
- ❖ can't discriminate between high- and low-metallicity models
- ❖ CNO value could select one class and break degeneracy with opacity

# Solar ${}^8\text{B}$ $\nu$ 's and Solar Models

- ❖ measure value and stability) of solar core temperature
- ❖ can't discriminate between high- and low-metallicity models
- ❖ CNO value could select one class and break degeneracy with opacity

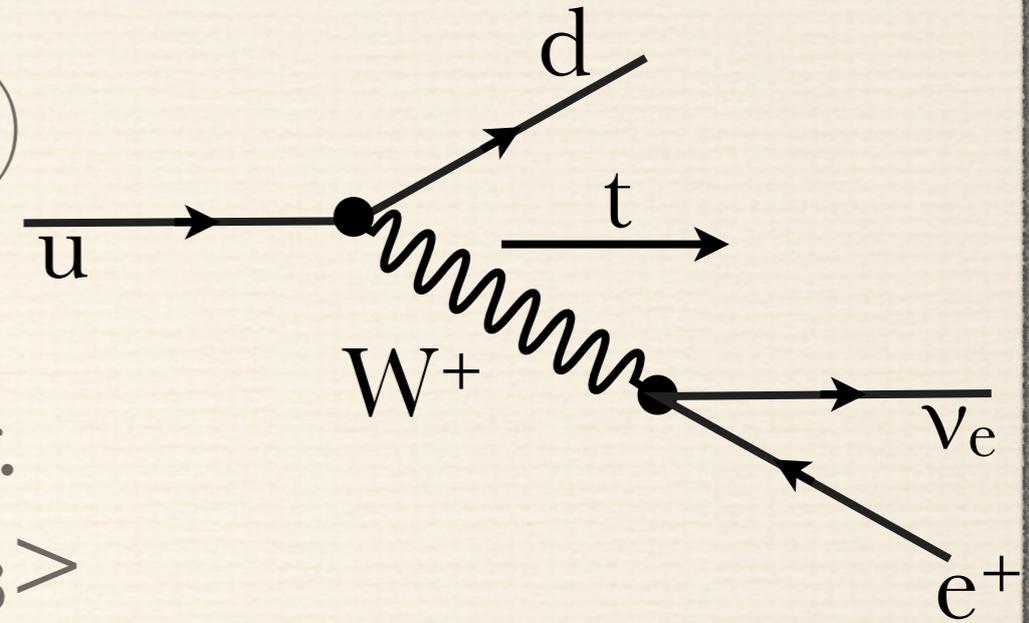

# Mass and Weak Eigenstates

- ❖ weak or flavor eigenstate if  $\nu$ 's created by  $W$ 's (e.g.  $\beta^+$  decay:  $\nu_e$ 's)
- ❖ linear comb. of mass eigenstates (neutrinos with definite mass): e.g.  
$$|\nu_e\rangle = U_{e1} |\nu_1\rangle + U_{e2} |\nu_2\rangle + U_{e3} |\nu_3\rangle$$
- ❖  $\nu$ 's propagate as mass eigenstates, (usual plane wave  $e^{i(\vec{p}\cdot\vec{r}-Et)/\hbar}$ )  
$$E^2 = m^2c^4 + p^2c^2: p \approx E/c - m^2c^3/(2E)$$
- ❖ component phases of  $|\nu_e\rangle$  shift with time/distance:  **$\nu$  oscillations**

# Mass and Weak Eigenstates

- ❖ weak or flavor eigenstate if  $\nu$ 's created by  $W$ 's (e.g.  $\beta^+$  decay:  $\nu_e$ 's)
- ❖ linear comb. of mass eigenstates (neutrinos with definite mass): e.g.  
$$|\nu_e\rangle = U_{e1} |\nu_1\rangle + U_{e2} |\nu_2\rangle + U_{e3} |\nu_3\rangle$$

- ❖  $\nu$ 's propagate as mass eigenstates, (usual plane wave  $e^{i(\vec{p}\cdot\vec{r}-Et)/\hbar}$ )  
$$E^2 = m^2c^4 + p^2c^2: p \approx E/c - m^2c^3/(2E)$$
- ❖ component phases of  $|\nu_e\rangle$  shift with time/distance:  **$\nu$  oscillations**

# Mass and Weak Eigenstates

❖ weak or flavor eigenstate if  $\nu$ 's created by  $W$ 's (e.g.  $\beta^+$  decay:  $\nu_e$ 's)

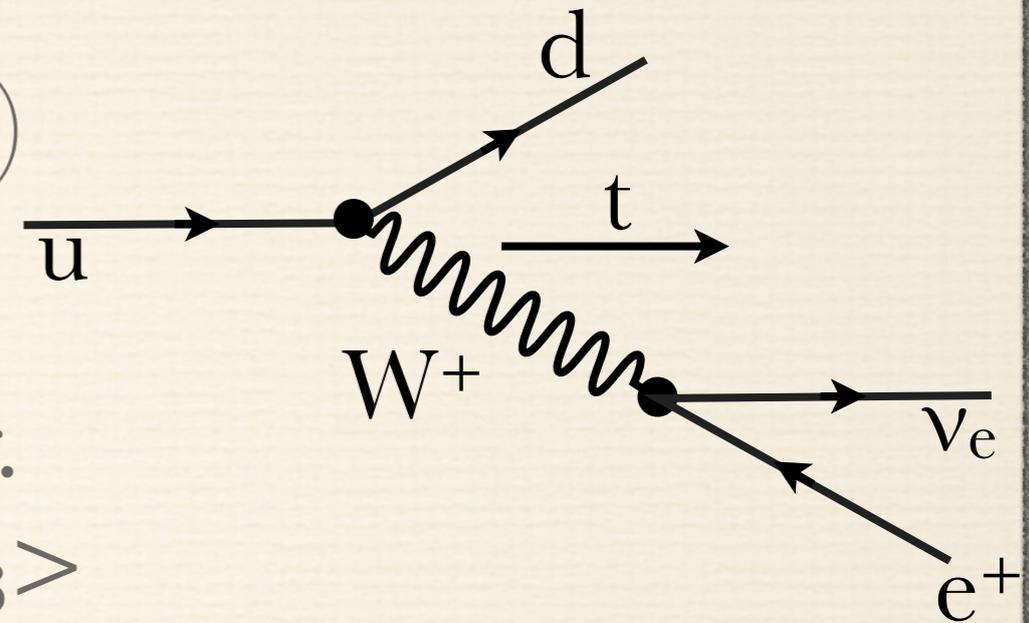

❖ linear comb. of mass eigenstates (neutrinos with definite mass): e.g.

$$|\nu_e\rangle = U_{e1} |\nu_1\rangle + U_{e2} |\nu_2\rangle + U_{e3} |\nu_3\rangle$$

❖  $\nu$ 's propagate as mass eigenstates, (usual plane wave  $e^{i(\vec{p}\cdot\vec{r}-Et)/\hbar}$ )

$$E^2 = m^2c^4 + p^2c^2: p \approx E/c - m^2c^3/(2E)$$

❖ component phases of  $|\nu_e\rangle$  shift with time/distance:  **$\nu$  oscillations**

PMNS Matrix

$$\begin{pmatrix} |\nu_e\rangle \\ |\nu_\mu\rangle \\ |\nu_\tau\rangle \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu1} & U_{\mu2} & U_{\mu3} \\ U_{\tau1} & U_{\tau2} & U_{\tau3} \end{pmatrix} \begin{pmatrix} |\nu_1\rangle \\ |\nu_2\rangle \\ |\nu_3\rangle \end{pmatrix}$$

# Mass and Weak Eigenstates

❖ weak or flavor eigenstate if  $\nu$ 's created by  $W$ 's (e.g.  $\beta^+$  decay:  $\nu_e$ 's)

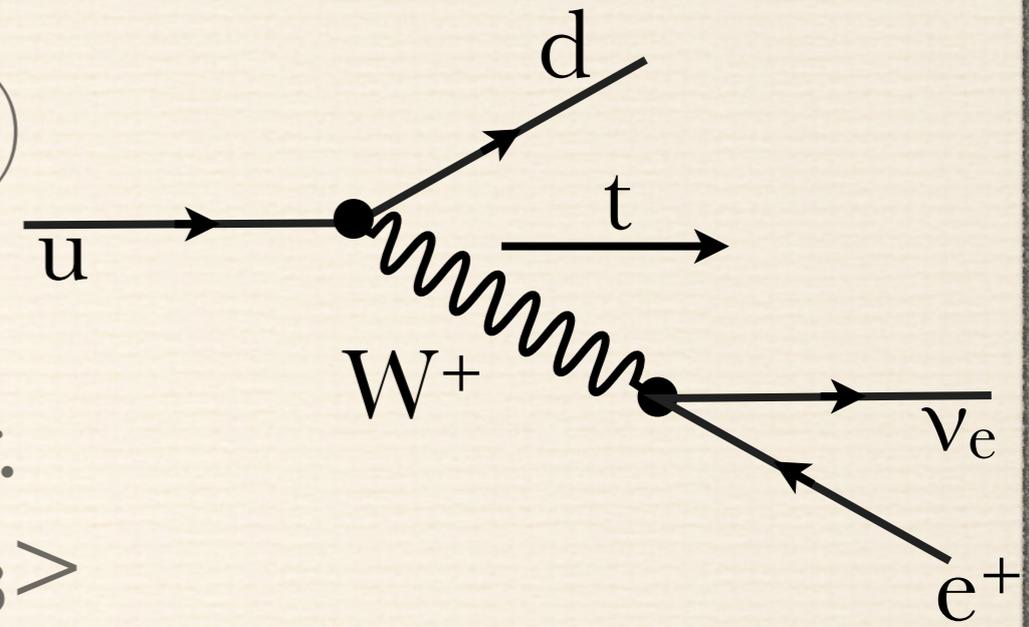

❖ linear comb. of mass eigenstates (neutrinos with definite mass): e.g.

$$|\nu_e\rangle = U_{e1} |\nu_1\rangle + U_{e2} |\nu_2\rangle + U_{e3} |\nu_3\rangle$$

❖  $\nu$ 's propagate as mass eigenstates, (usual plane wave  $e^{i(\vec{p}\cdot\vec{r}-Et)/\hbar}$ )

$$E^2 = m^2c^4 + p^2c^2: p \approx E/c - m^2c^3/(2E)$$

❖ component phases of  $|\nu_e\rangle$  shift with time/distance:  **$\nu$  oscillations**

PMNS Matrix

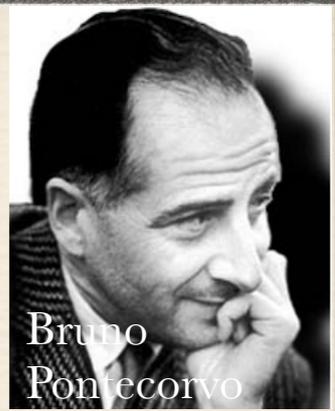

$$\begin{pmatrix} |\nu_e\rangle \\ |\nu_\mu\rangle \\ |\nu_\tau\rangle \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu1} & U_{\mu2} & U_{\mu3} \\ U_{\tau1} & U_{\tau2} & U_{\tau3} \end{pmatrix} \begin{pmatrix} |\nu_1\rangle \\ |\nu_2\rangle \\ |\nu_3\rangle \end{pmatrix}$$

phase shift after distance  $L$

$$\Delta\phi_{ij}(L) = \frac{m_i^2 - m_j^2}{2E} \frac{c^3}{\hbar} L = \frac{\Delta m_{ij}^2 c^3}{2E\hbar} L$$

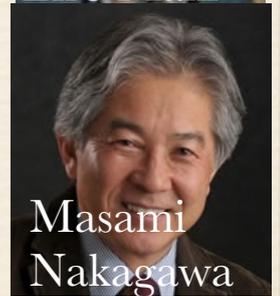

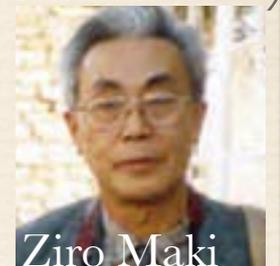

# PMNS Matrix

(Pontecorvo-Maki-Nakagawa-Sakata)

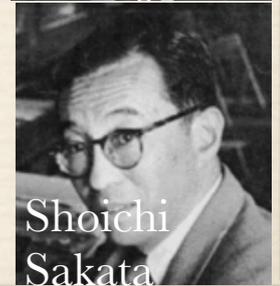

- ❖ parametrize: three angles, one phase:
  - ❖ solar angle  $\theta_{12}$  governing solar  $\nu$  oscillation
  - ❖ reactor angle  $\theta_{13}$  governing reactor  $\nu$  oscillation
  - ❖ atmospheric angle  $\theta_{23}$  governing atm.  $\nu$  oscillation
  - ❖ oscillation CP-violating phase  $\delta$  ( $\nu$  beams)
- ❖ (two more CP phases  $\alpha_1, \alpha_2$  if  $\nu$ 's are Majorana-particles)
- ❖ use  $c_{ij} = \cos \theta_{ij}$  and  $s_{ij} = \sin \theta_{ij}$ ,

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

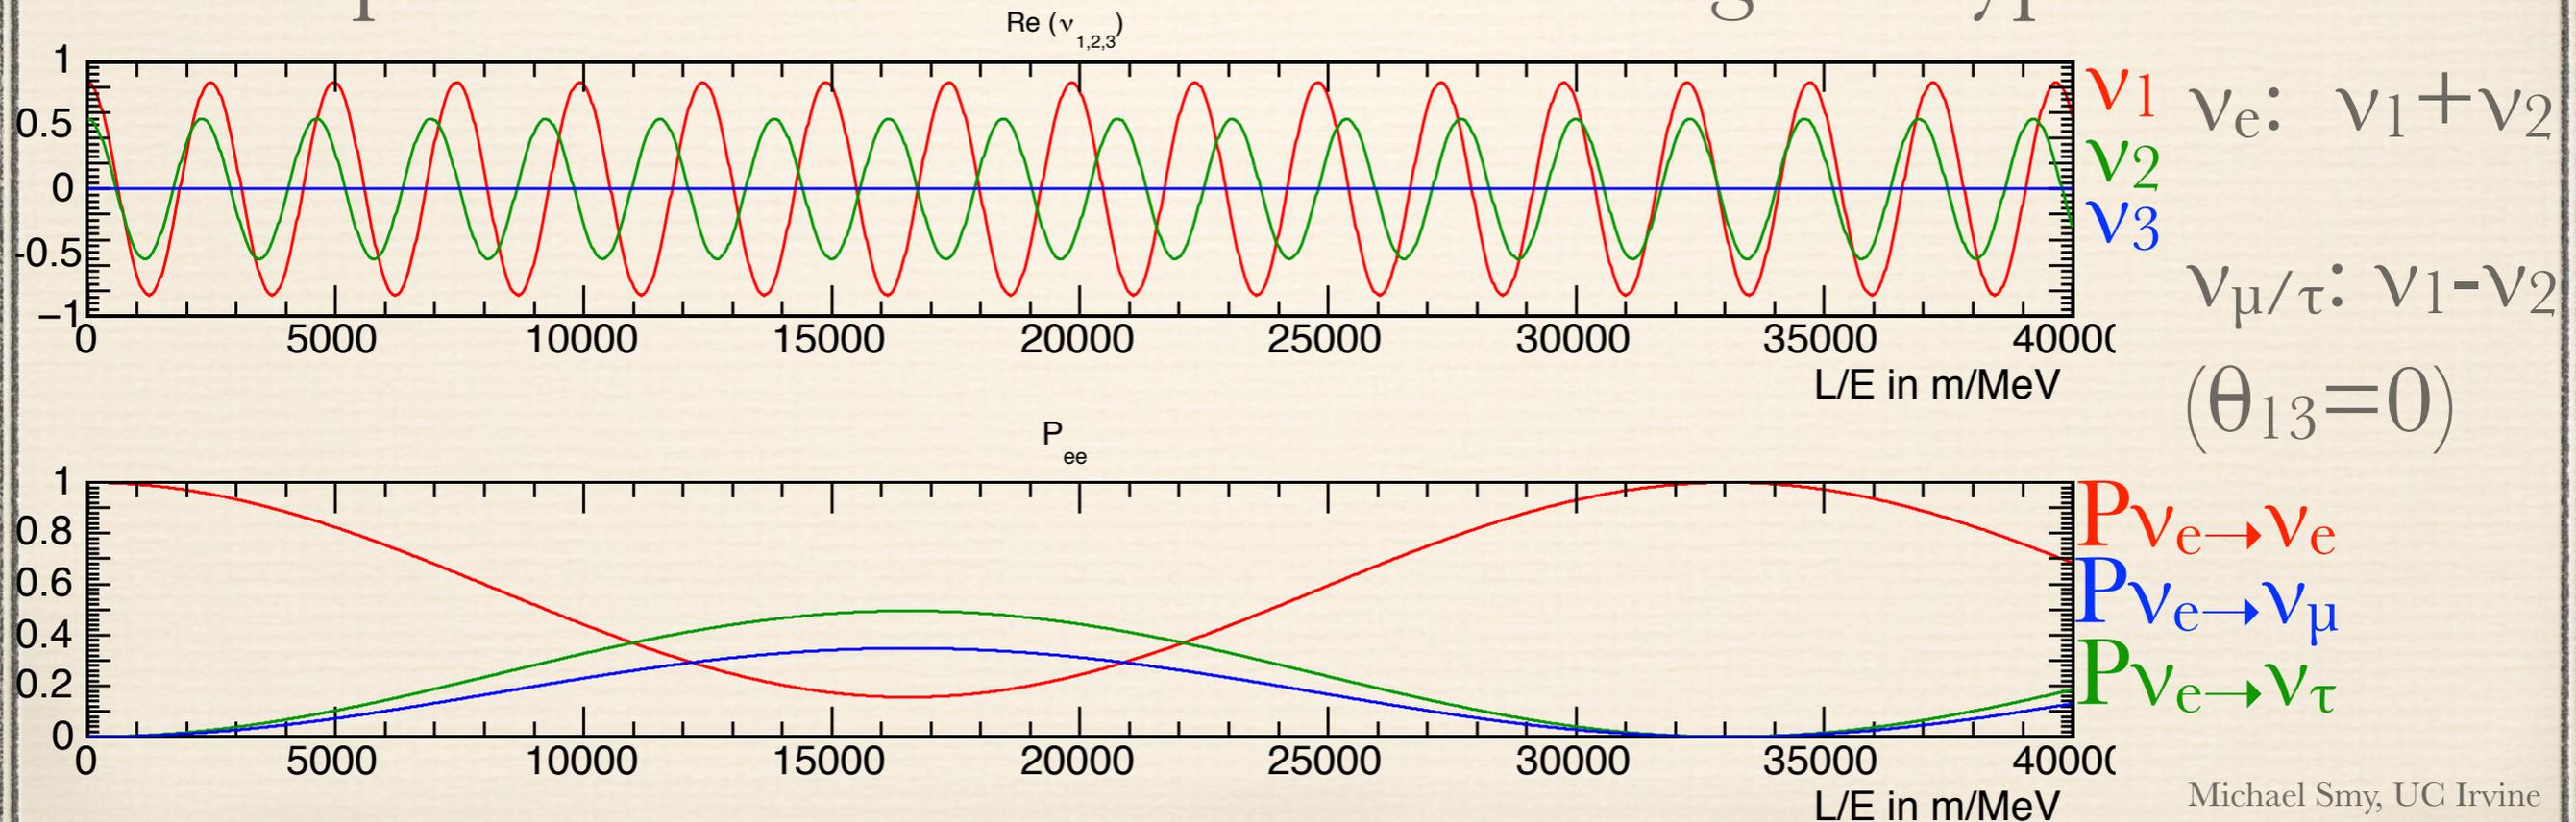

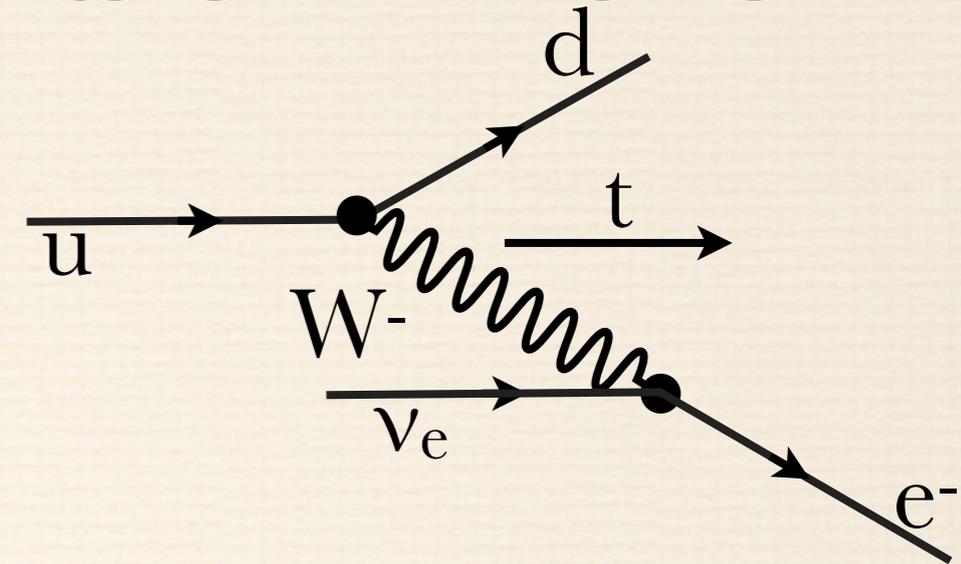

- ❖ approximate numerical values:

$$\begin{pmatrix} 0.826 & 0.544 & 0.075 + i0.130 \\ -0.462 + i0.070 & 0.613 + i0.046 & 0.635 \\ 0.305 + i0.083 & -0.569 + i0.055 & 0.757 \end{pmatrix}$$

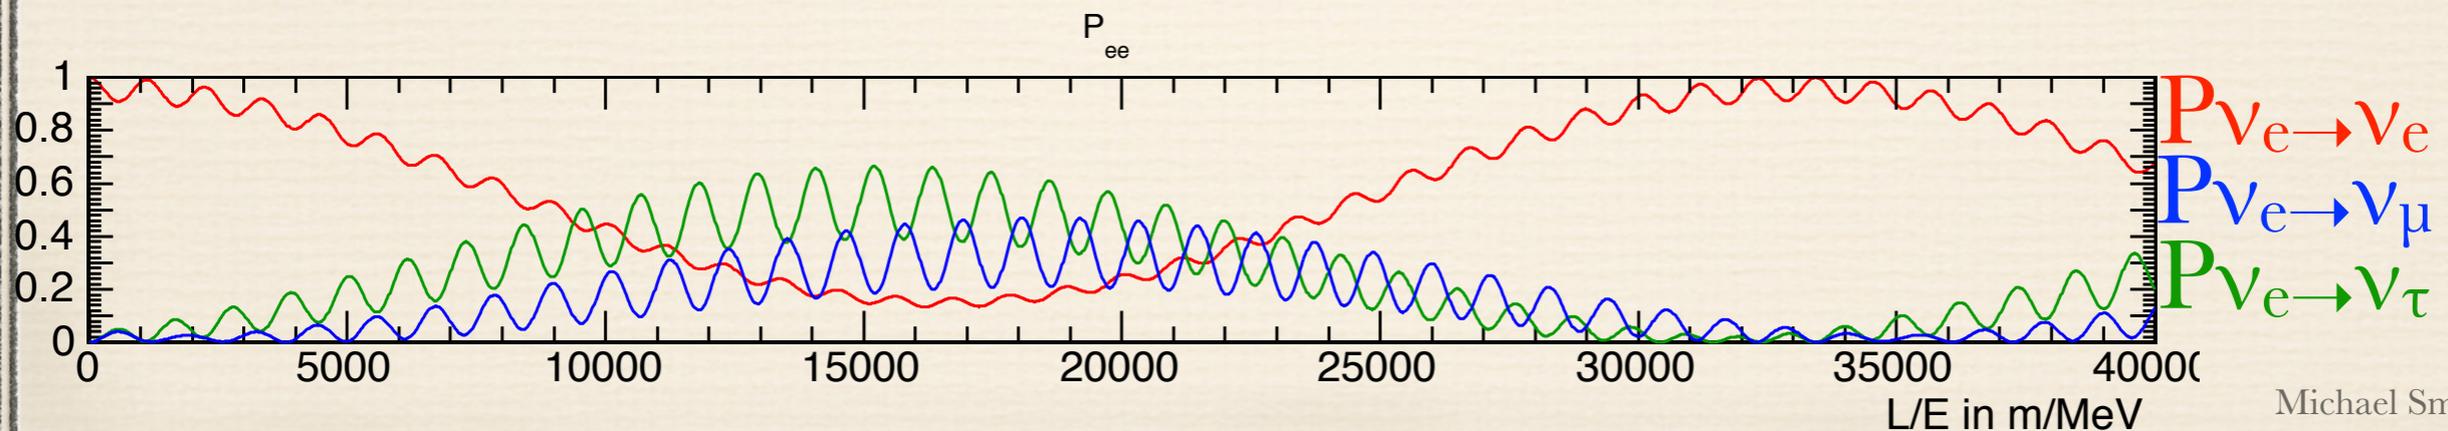

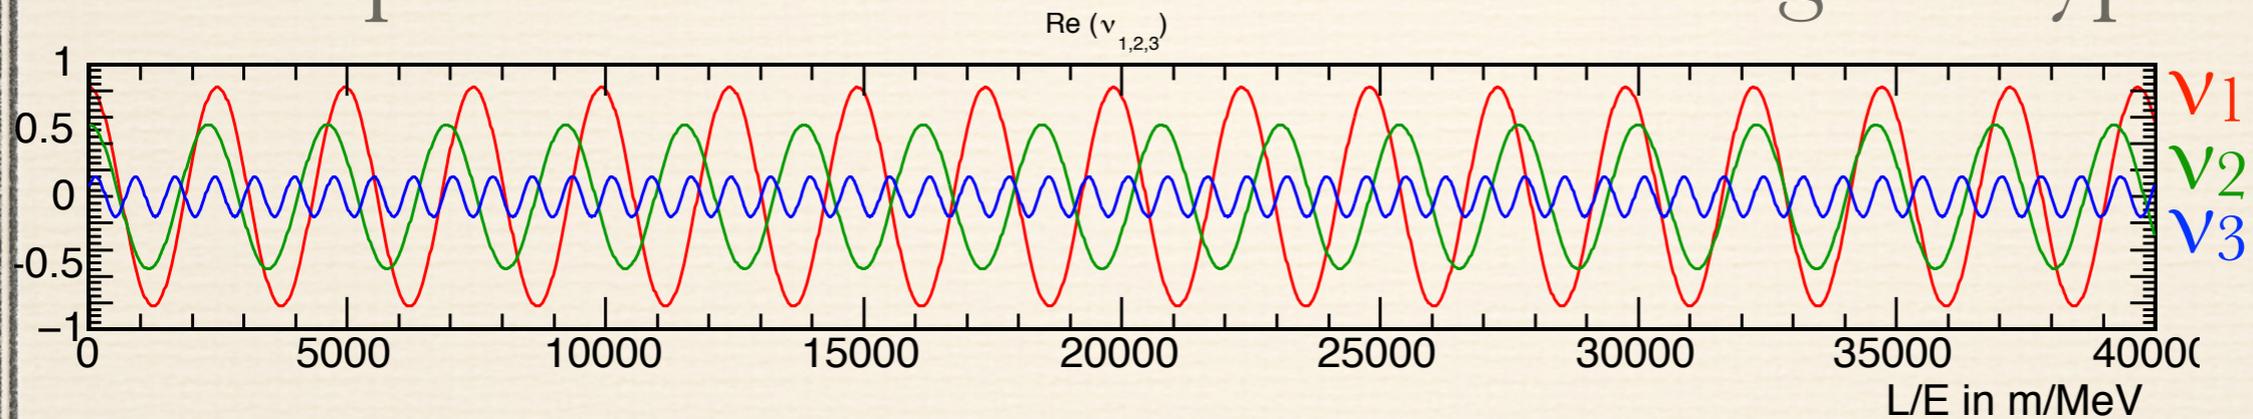

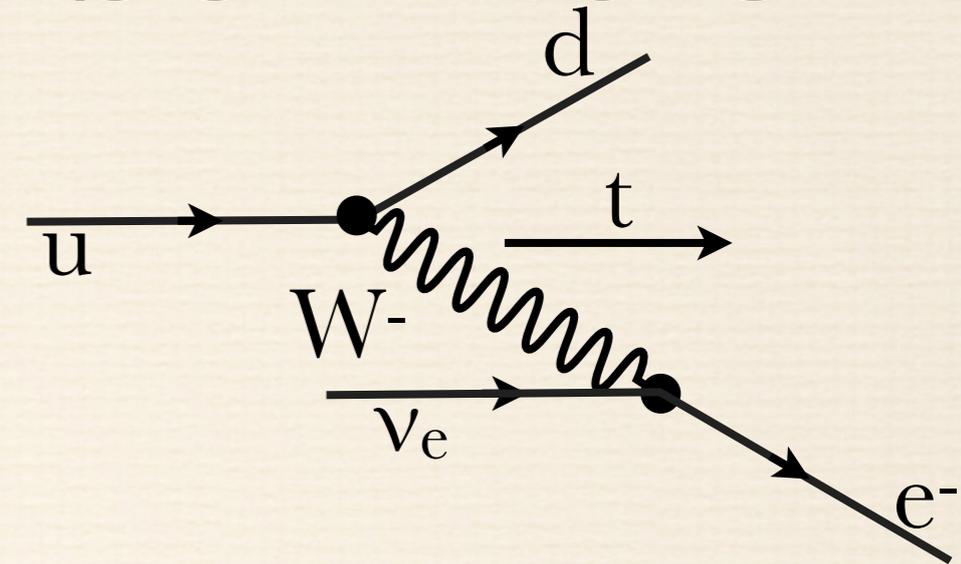

# Neutrino Flavor Oscillation

- ❖ when neutrinos are detected by conversion to lepton ( $W$ 's): after distance  $L$  there probability of detecting a different type
- ❖ “disappearance” of production type may not be complete at any  $L$ , but composition must return to 100% original type

# Neutrino Flavor Oscillation

- ❖ when neutrinos are detected by conversion to lepton ( $W$ 's): after distance  $L$  there probability of detecting a different type
- ❖ “disappearance” of production type may not be complete at any  $L$ , but composition must return to 100% original type

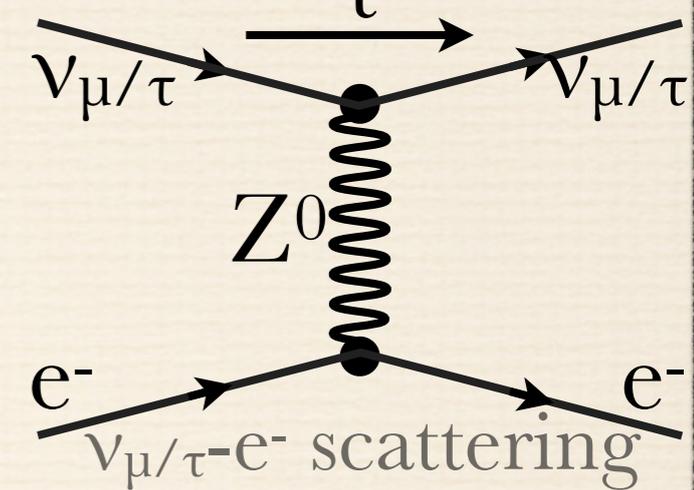

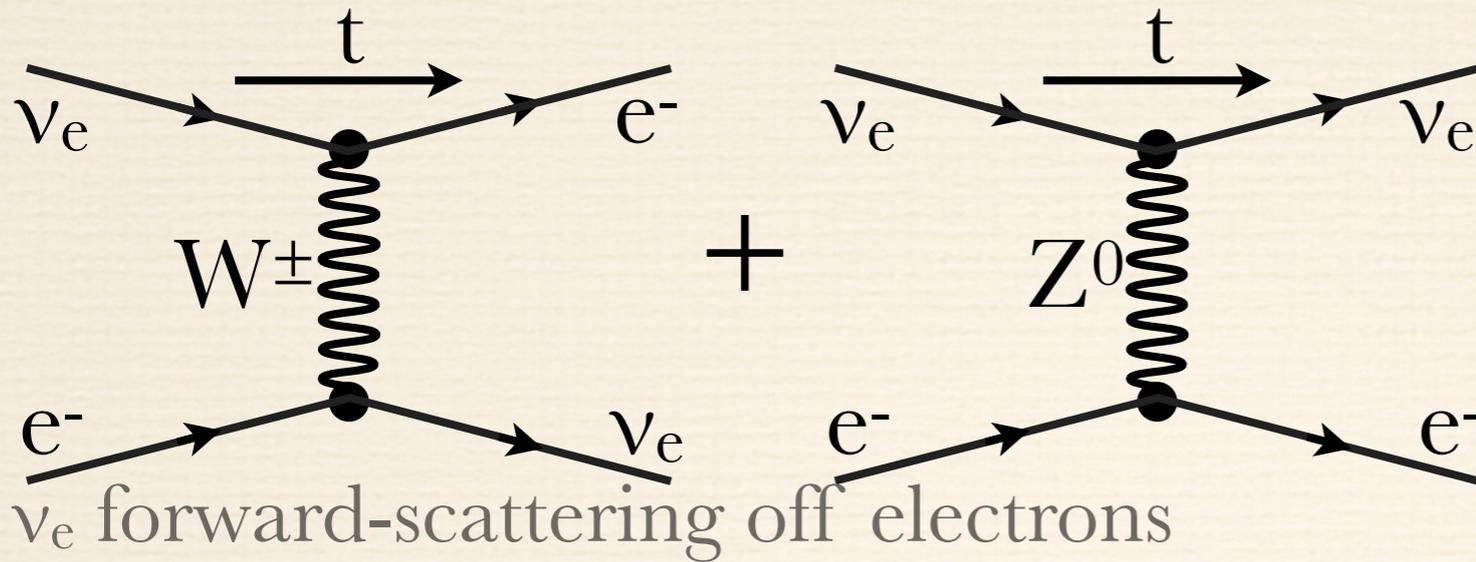

# Quark and Lepton Mixing

- ❖ in weak interactions, down-type quarks mix just as  $\nu$ 's
- ❖ quark mixing angles are small; biggest is Cabibbo Angle
- ❖ big neutrino mixing angles: first discovered by Super-K in 1998 ( $\theta_{23}$  from atm.  $\nu$ ), 2000 ( $\theta_{12}$  from solar  $\nu$ ) and Super-K/T2K in 2011 ( $\theta_{13}$  from an intense  $\nu$ -beam)
- ❖ now:  $\theta_{12}$  from Super-K/SNO,  $\theta_{13}$  from Daya-Bay/Reno/Double Chooz,  $\theta_{23}$  from Super-K/T2K

	$\theta_{12}$	$\theta_{13}$	$\theta_{23}$	$\delta$
quarks	13.04	0.201	2.38	69
leptons	33.36	8.66	40.0 or 50.4	300

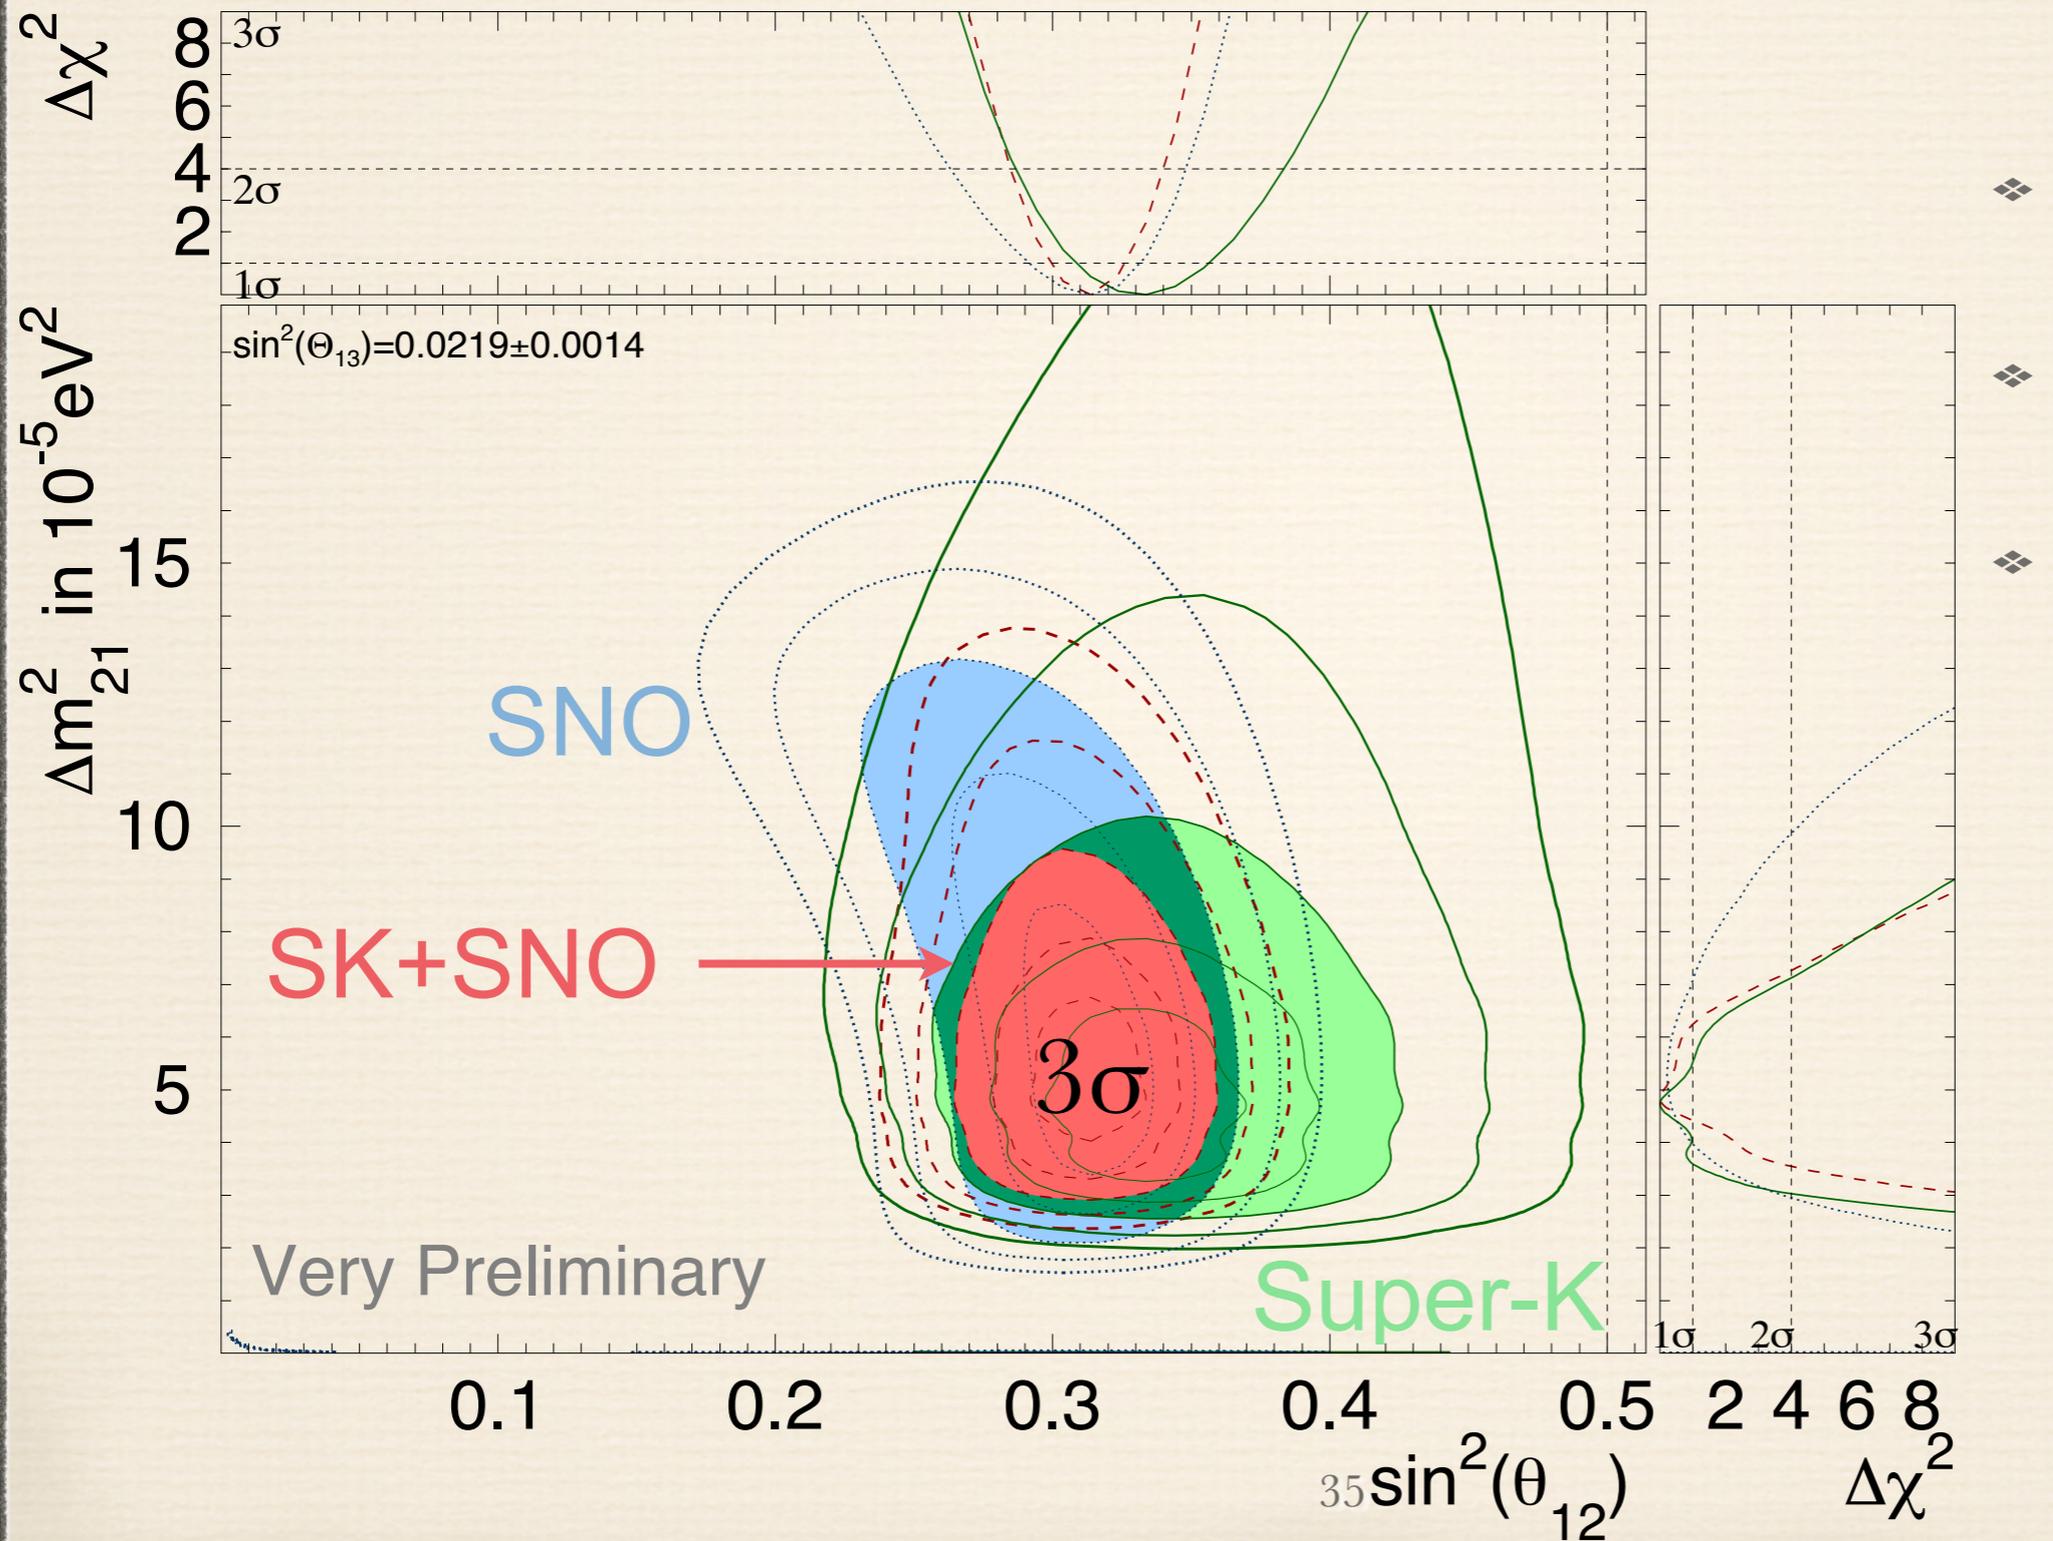

# MSW Effect

- ❖ matter interactions: phase shifts affecting  $\nu$  oscillations
- ❖ resonant conversion to  $\nu_2$  if  $\rho_e$  changes adiabatically
- ❖ extra “potential” of  $\nu_e$  (compared to  $\nu_{\mu/\tau}$ ) in a “Hamiltonian”
- ❖ similar to light propagation in medium (“index of refraction”), use effective mixing angle and  $\Delta m^2$

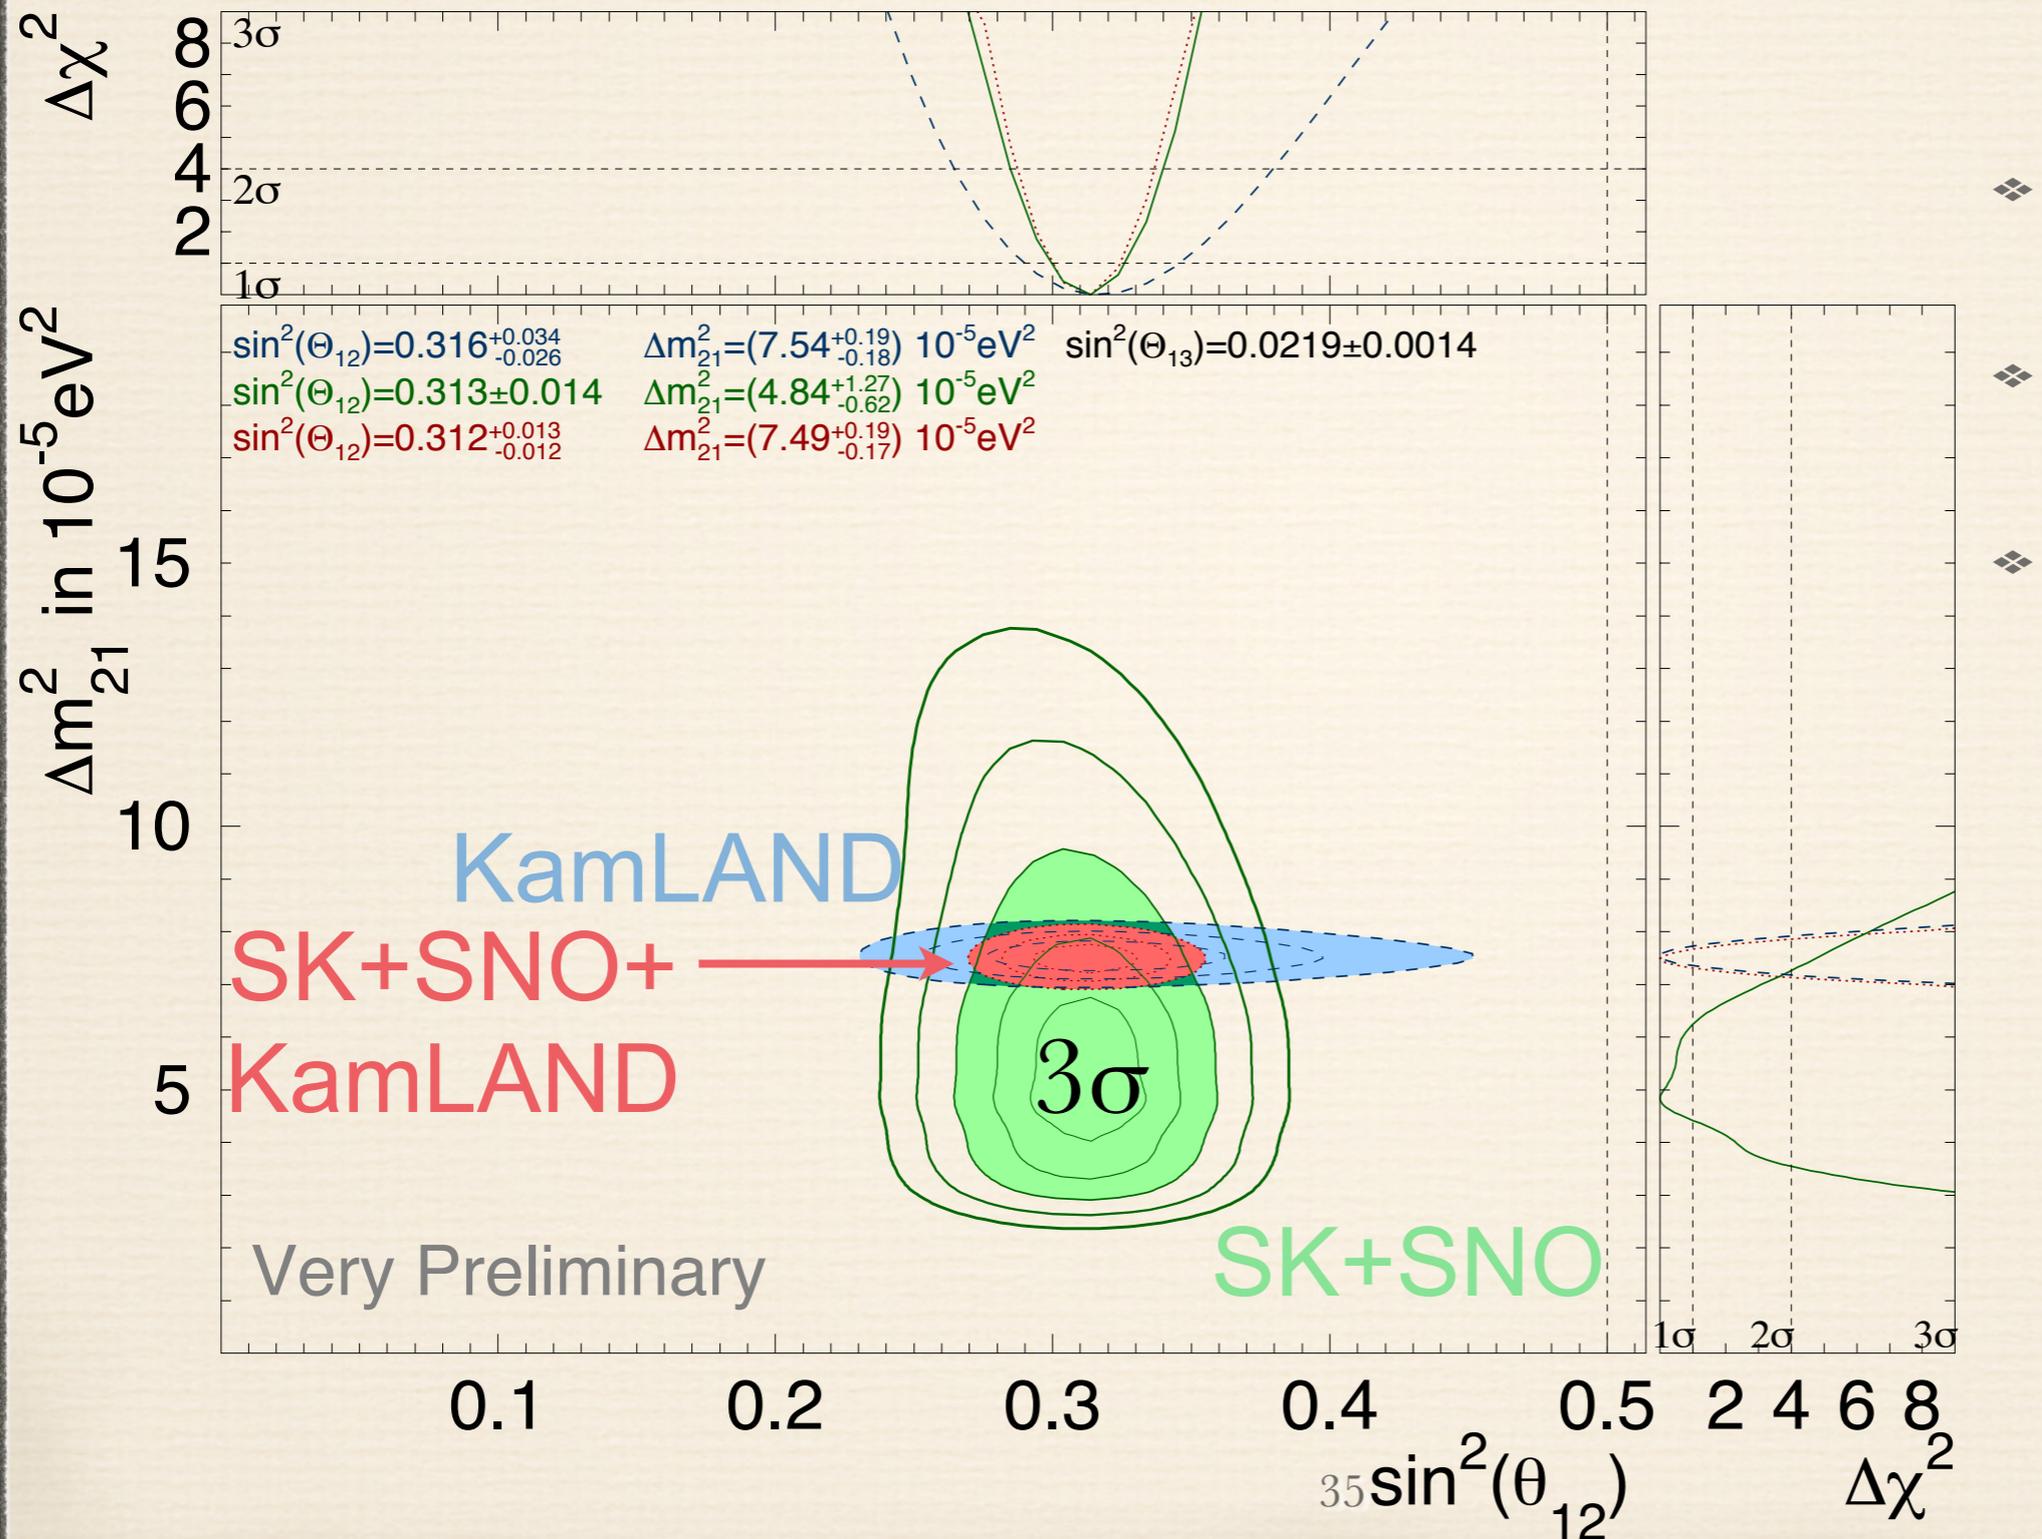

$$H_{matter} = \kappa \rho_e \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} + \frac{1}{2E} U_{PMNS}^\dagger \begin{pmatrix} 0 & 0 & 0 \\ 0 & \Delta m_{21}^2 & 0 \\ 0 & 0 & \Delta m_{31}^2 \end{pmatrix} U_{PMNS} \quad \kappa = \sqrt{2} G_F$$

# Solar $\nu$ Angle $\theta_{12}$ & Mass<sup>2</sup> Difference

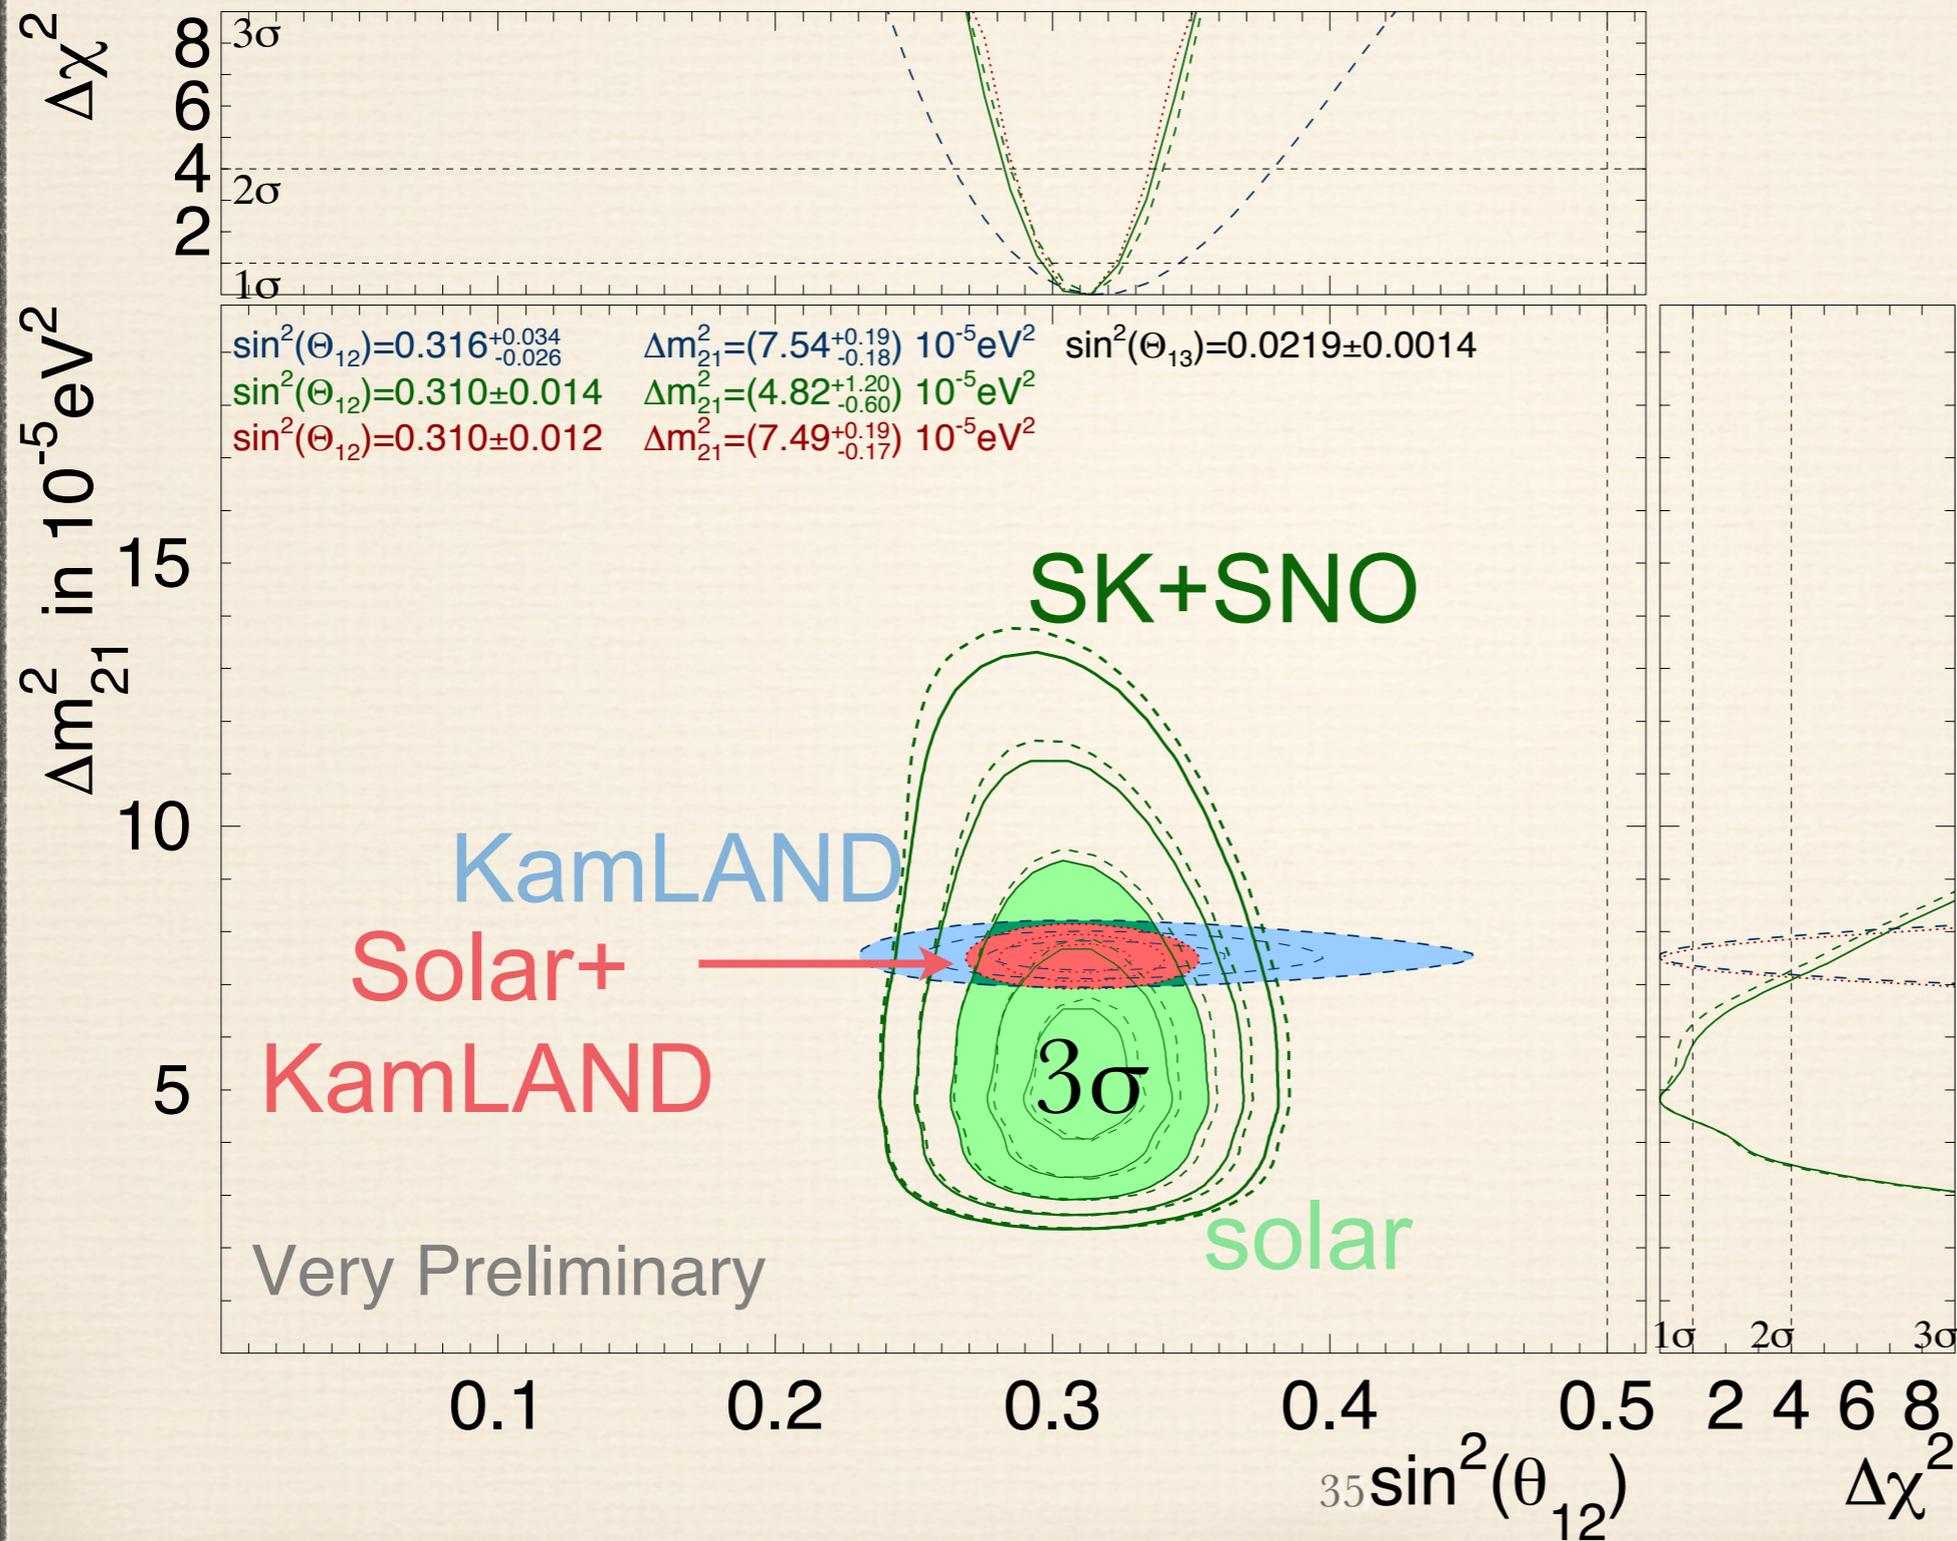

- ◆ Super-K data best constrains  $\Delta m_{21}^2$
- ◆ SNO data best constrains  $\sin^2\theta_{12}$
- ◆ correlation via  $^8\text{B}$  flux adds to complementarity

# Solar $\nu$ Angle $\theta_{12}$ & Mass<sup>2</sup> Difference

- ❖ Super-K data best constrains  $\Delta m^2_{21}$
- ❖ SNO data best constrains  $\sin^2\theta_{12}$
- ❖ correlation via  $^8\text{B}$  flux adds to complementarity

# Solar $\nu$ Angle $\theta_{12}$ & Mass<sup>2</sup> Difference

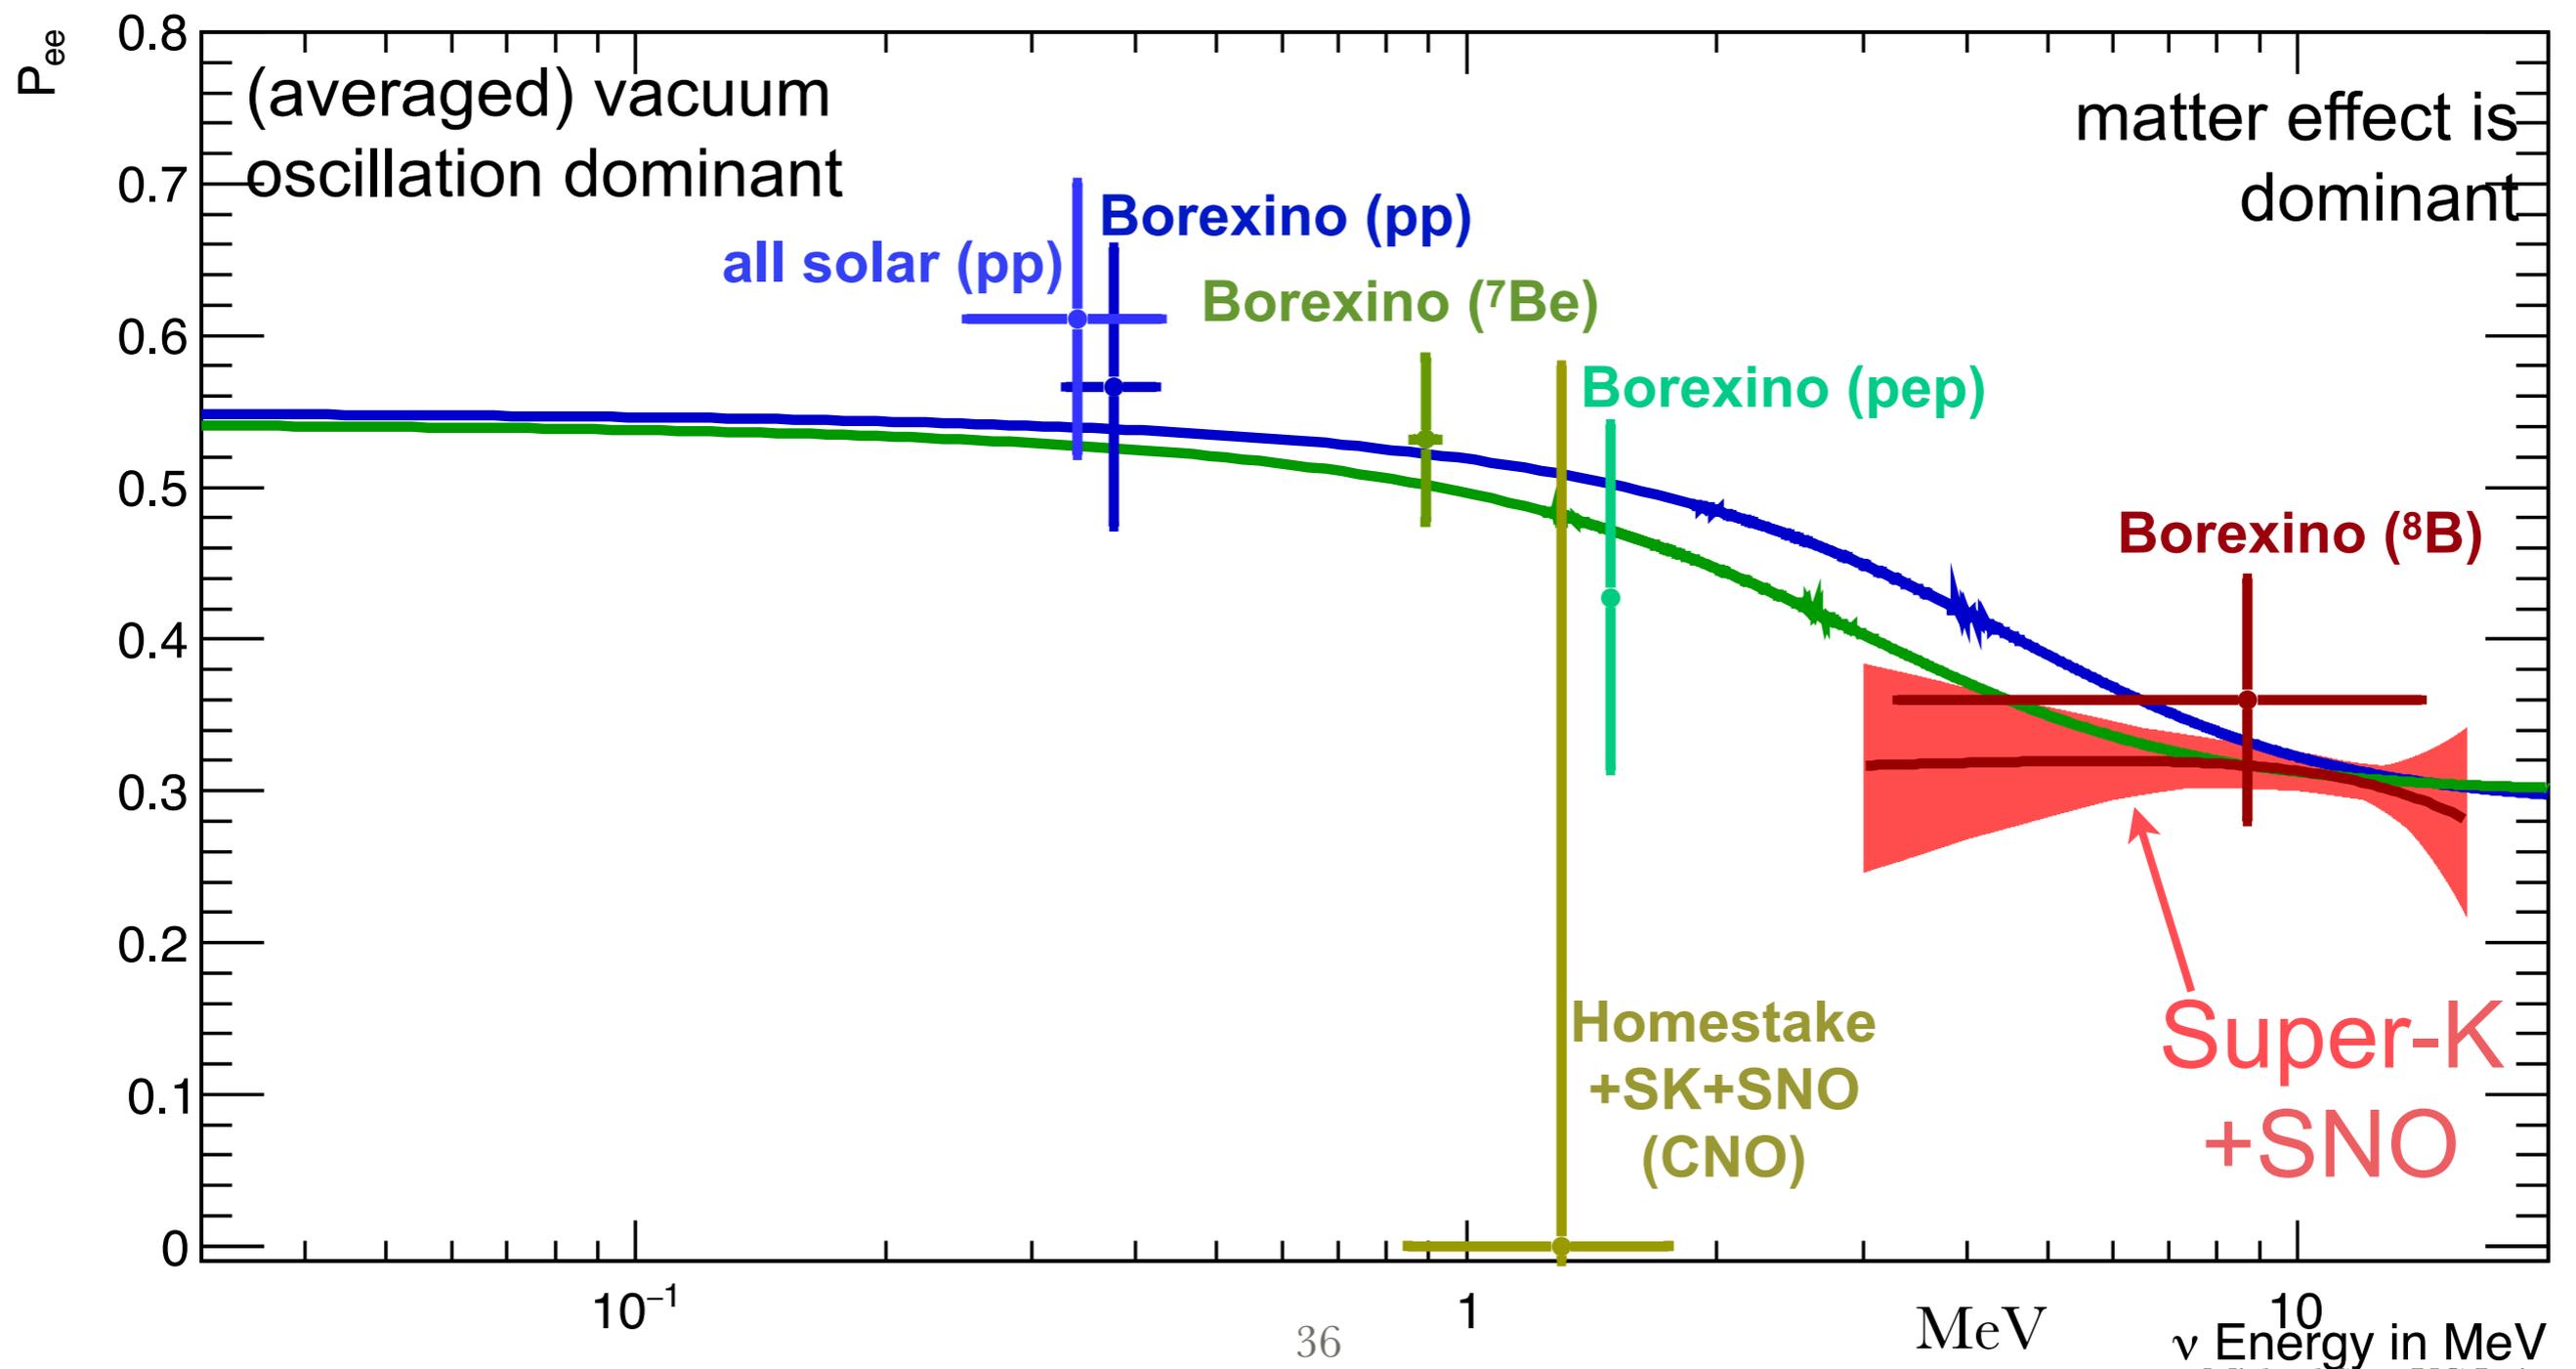

$\sin^2\theta_{12} = 0.310 \pm 0.014$   
 $\Delta m^2_{21} = 4.82^{+1.20}_{-0.60} \times 10^{-5} \text{eV}^2$

$\sin^2\theta_{12} = 0.316^{+0.034}_{-0.026}$   
 $\Delta m^2_{21} = 7.54^{+0.19}_{-0.18} \times 10^{-5} \text{eV}^2$

$\sin^2\theta_{12} = 0.310 \pm 0.012$   
 $\Delta m^2_{21} = 7.49^{+0.19}_{-0.17} \times 10^{-5} \text{eV}^2$

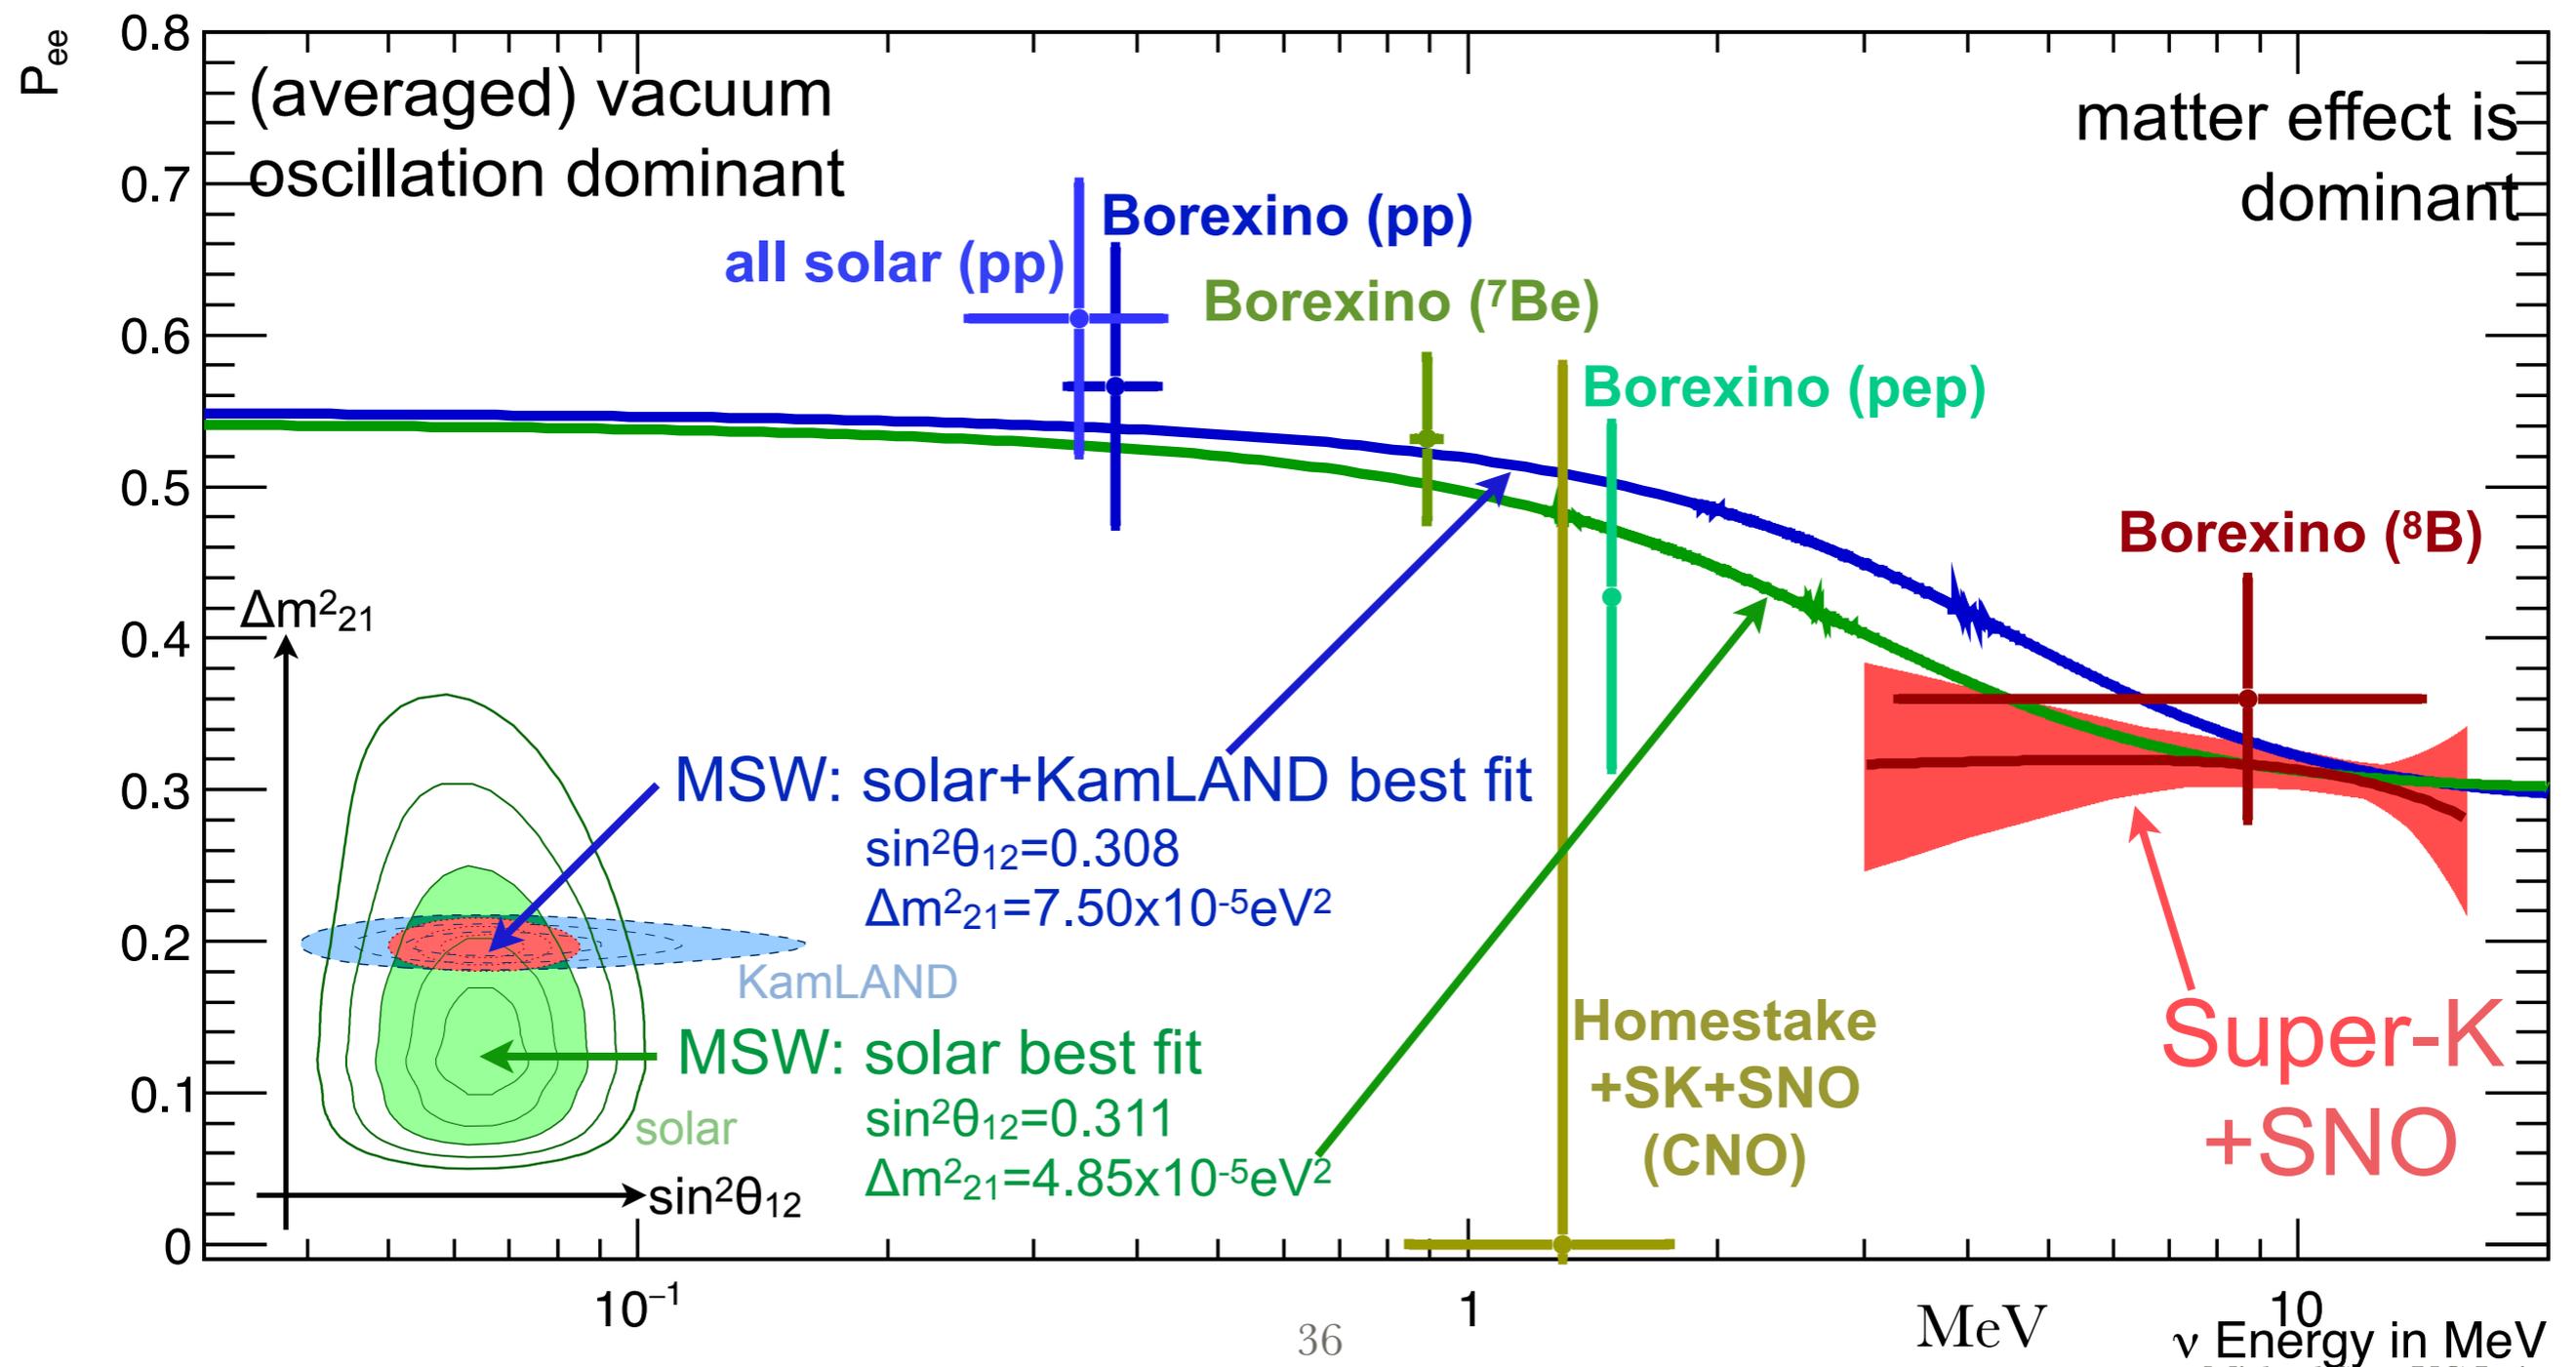

# Solar Neutrino Flavor Conversion

$P_{ee}$  versus  $\nu$  Energy

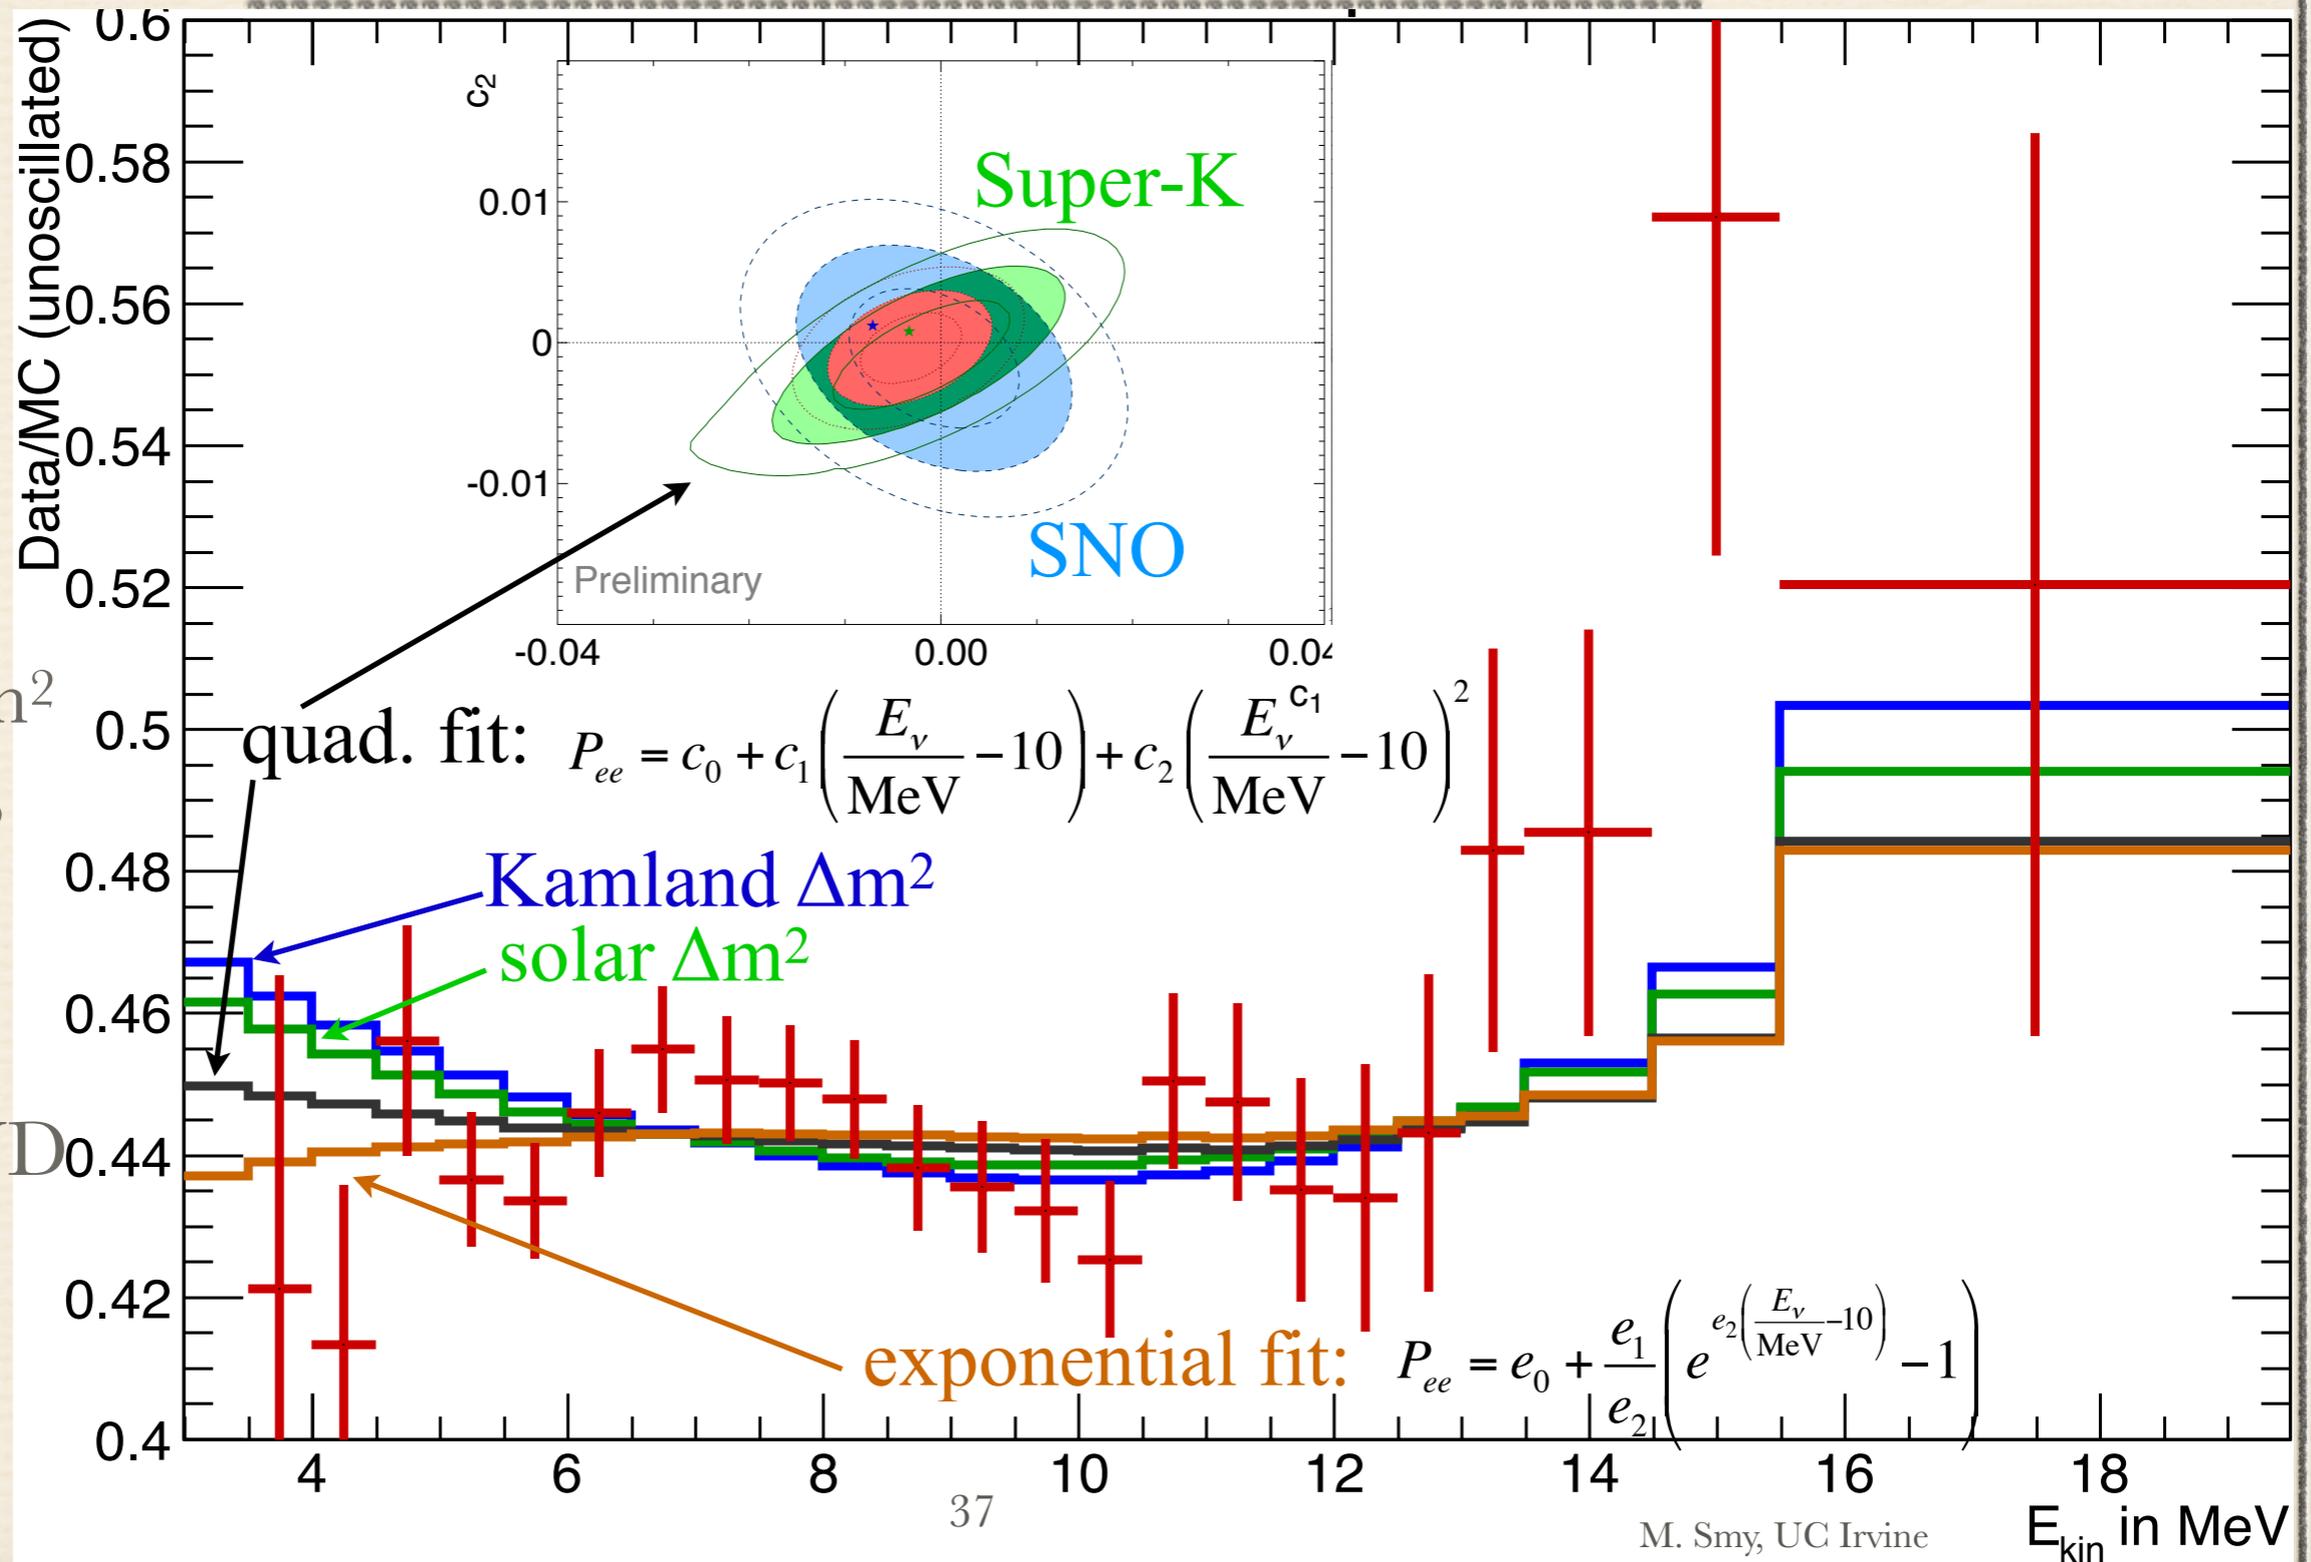

# Solar Neutrino Flavor Conversion

$P_{ee}$  versus  $\nu$  Energy

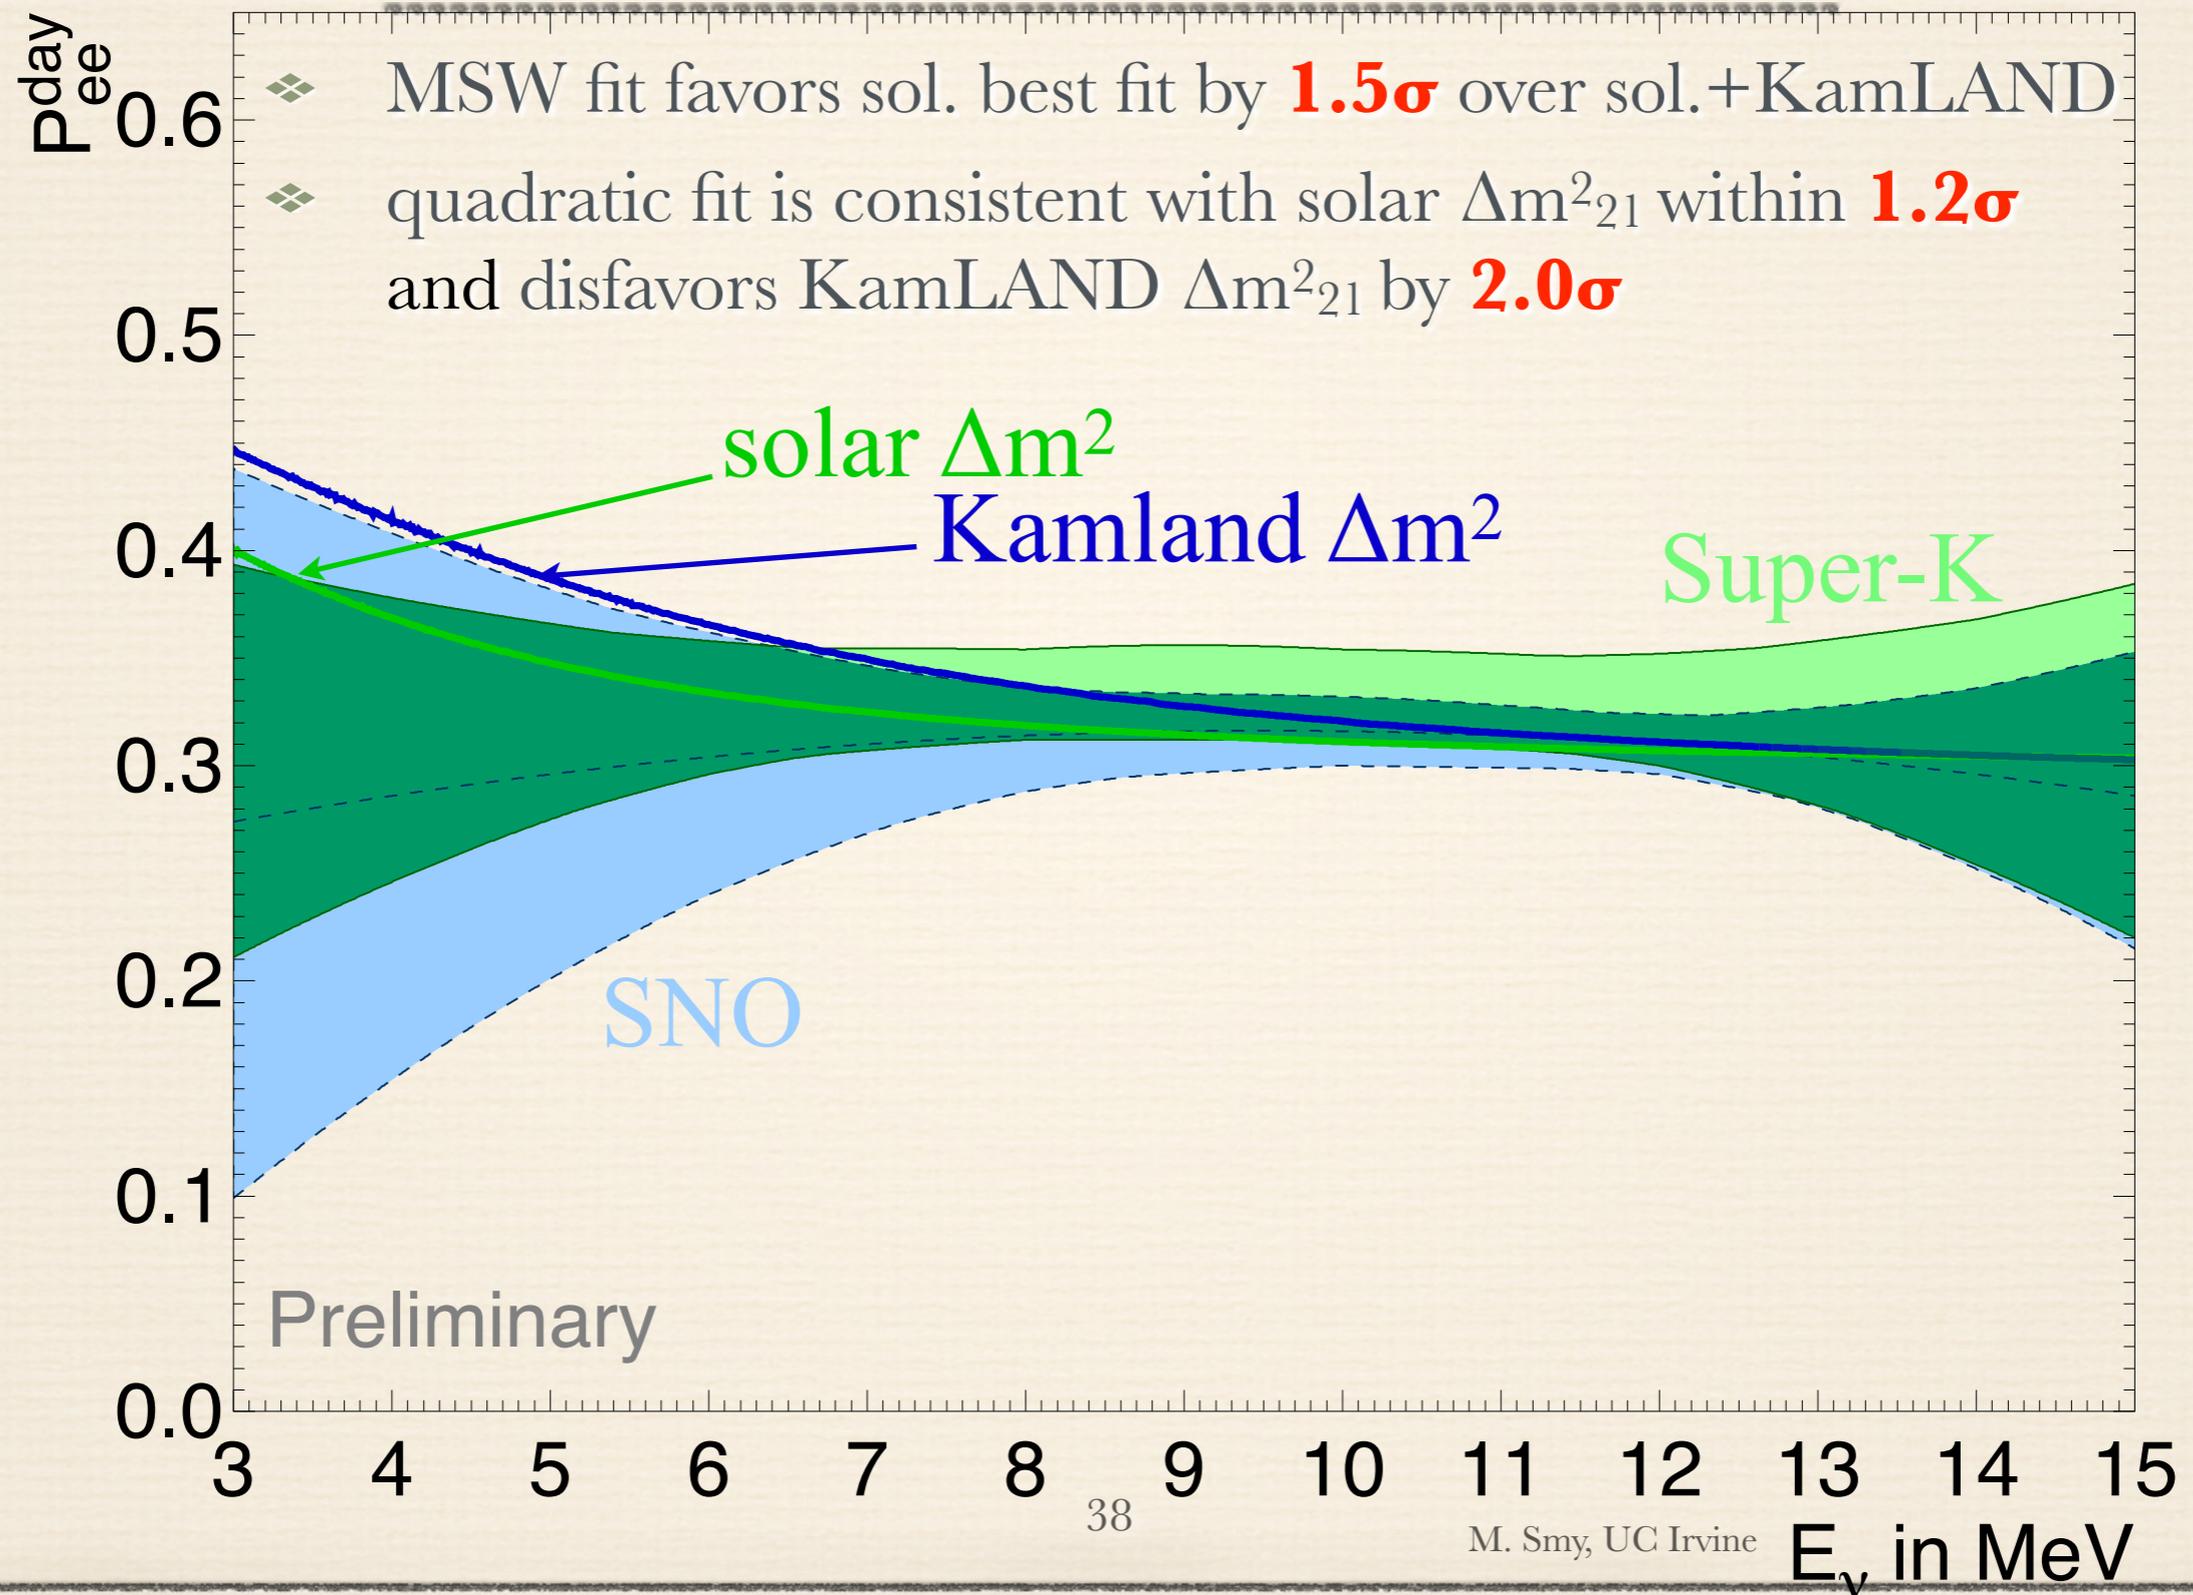

# Test Resonant Conversion in the Sun (MSW)

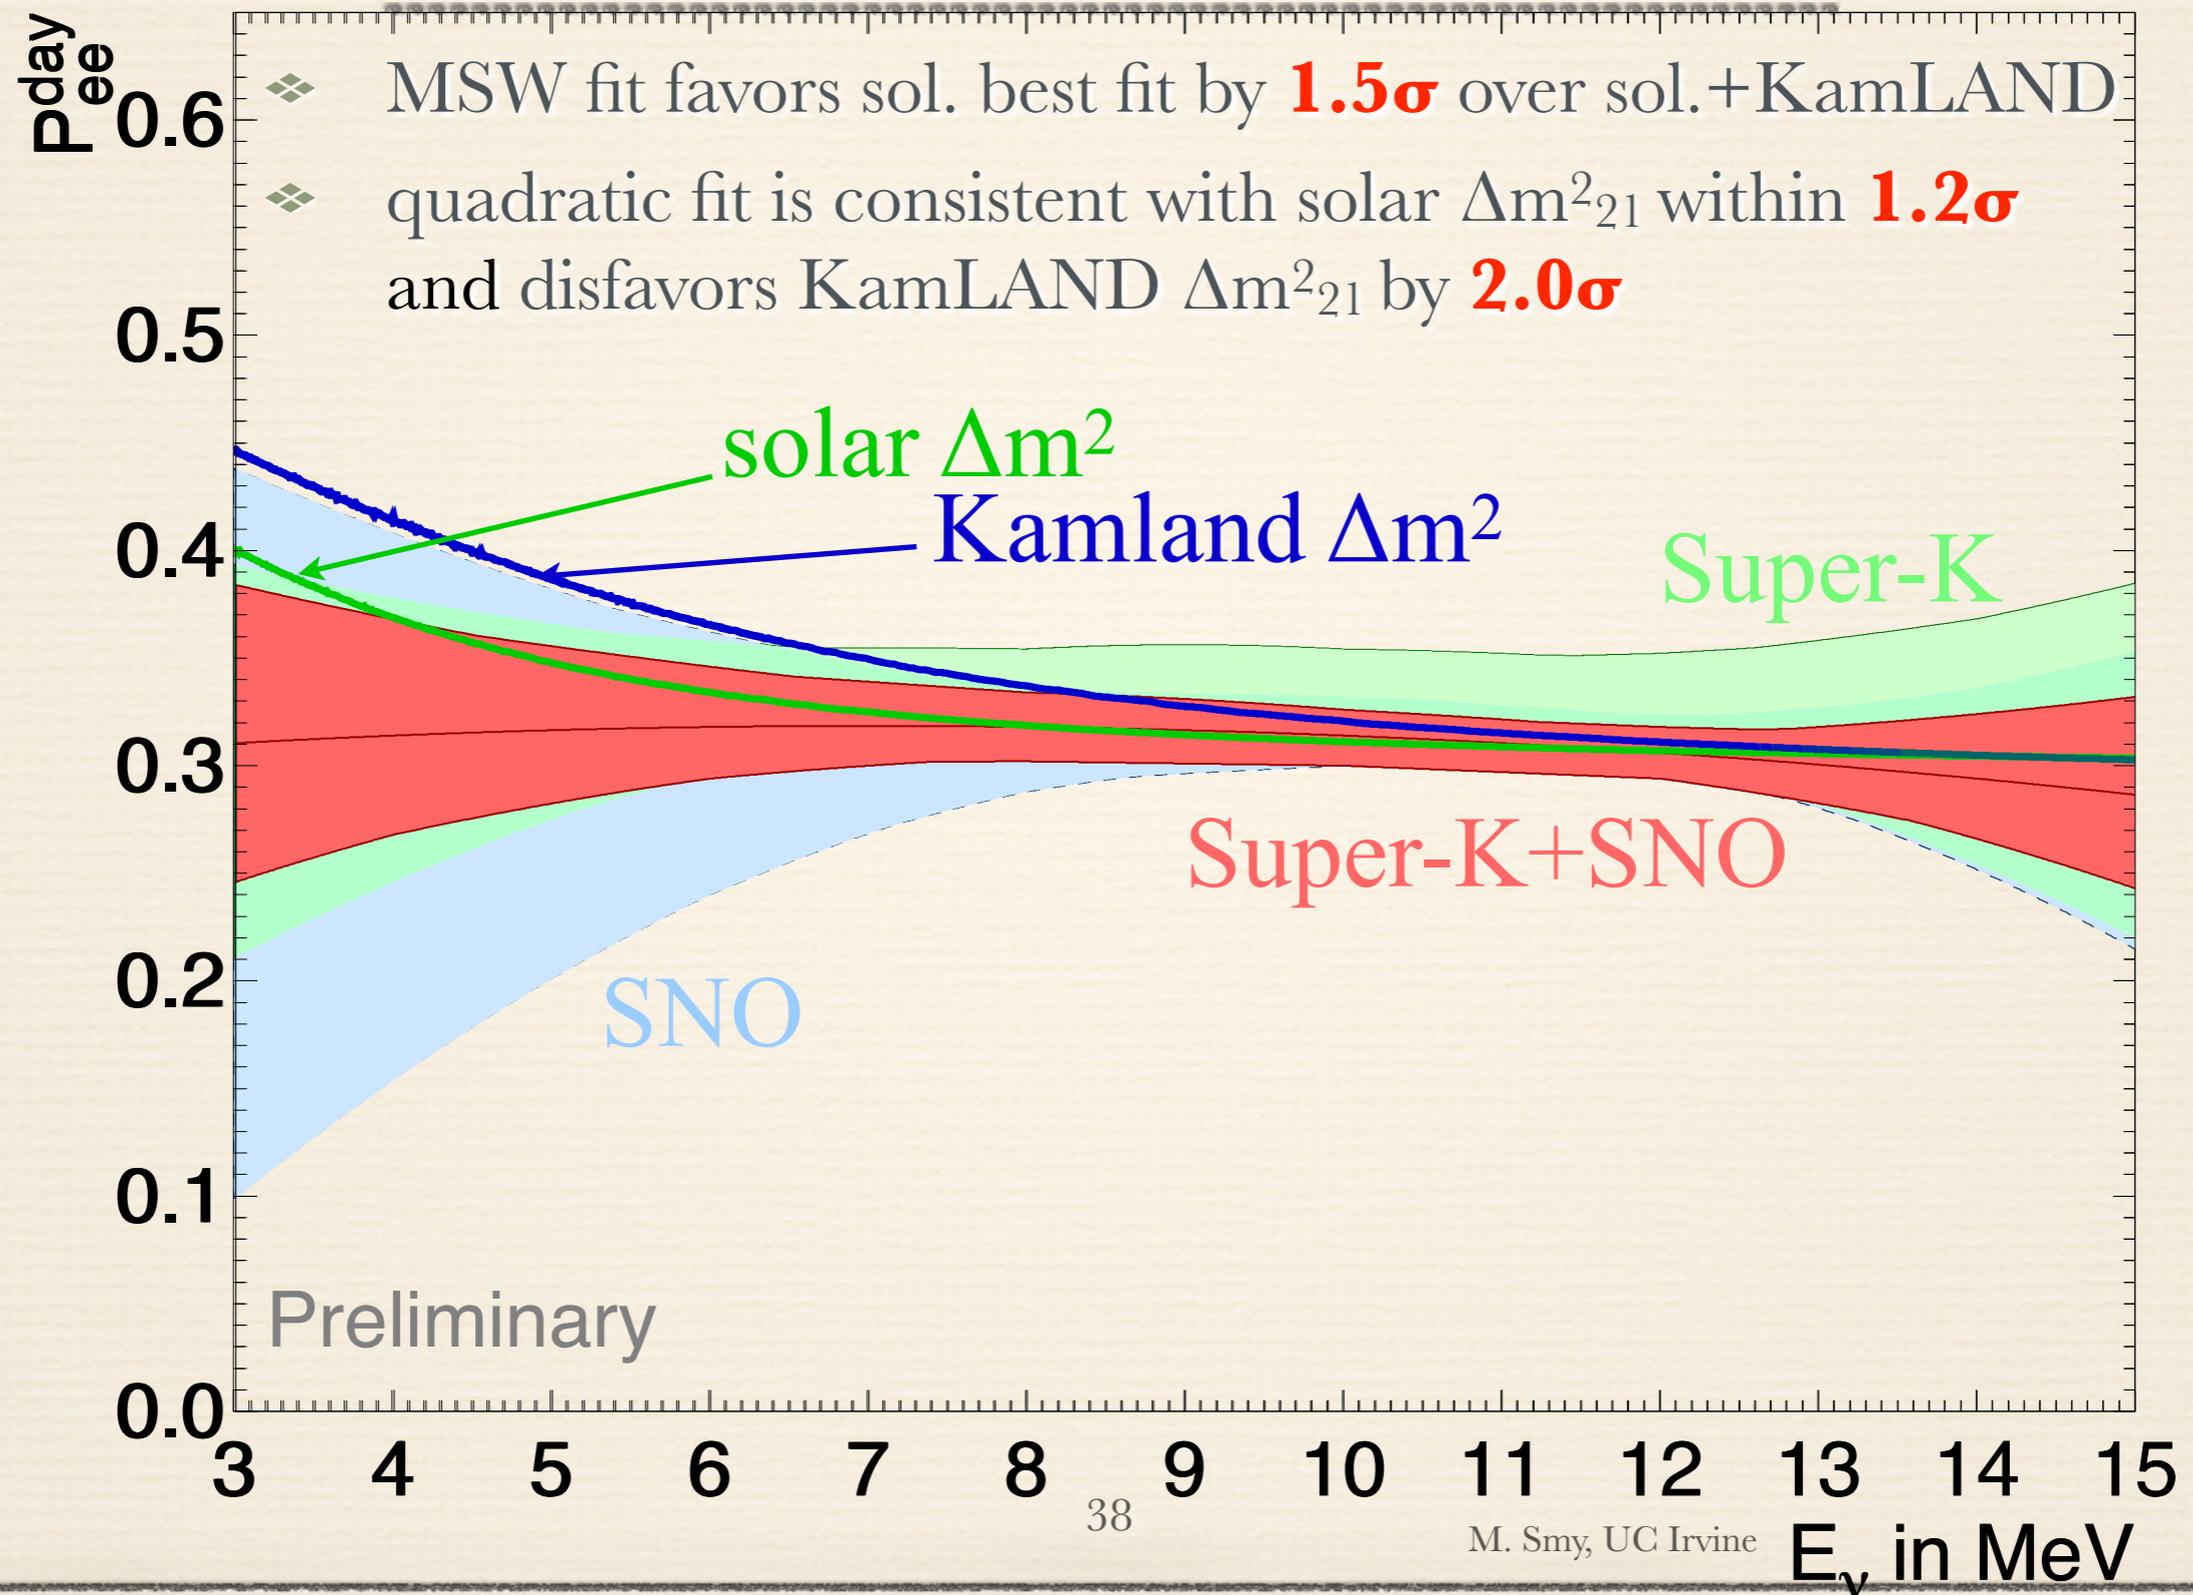

latest Super-K recoil  $e^-$  spectral data: consistent with solar best fit  $\Delta m^2$  within  $1\sigma$ , but  $\sim 2\sigma$  tension with KamLAND measurement

# Super-K and SNO: resulting $P_{ee}$

# Probe MSW: Future Improvements

- ❖ lower threshold: Wideband Intelligent Trigger has  $>90\%$  efficiency for kinetic energies  $>2.5$  MeV

- ❖ smaller spectral systematic uncertainty with better calibration:
  - ❖ linear accelerator injecting single electrons with  $E=5-18$  MeV
  - ❖ Deuterium-Tritium generator to make  $^{16}\text{N}$  with 14 MeV n's
  - ❖ Cosmic  $\mu$  Spallation products

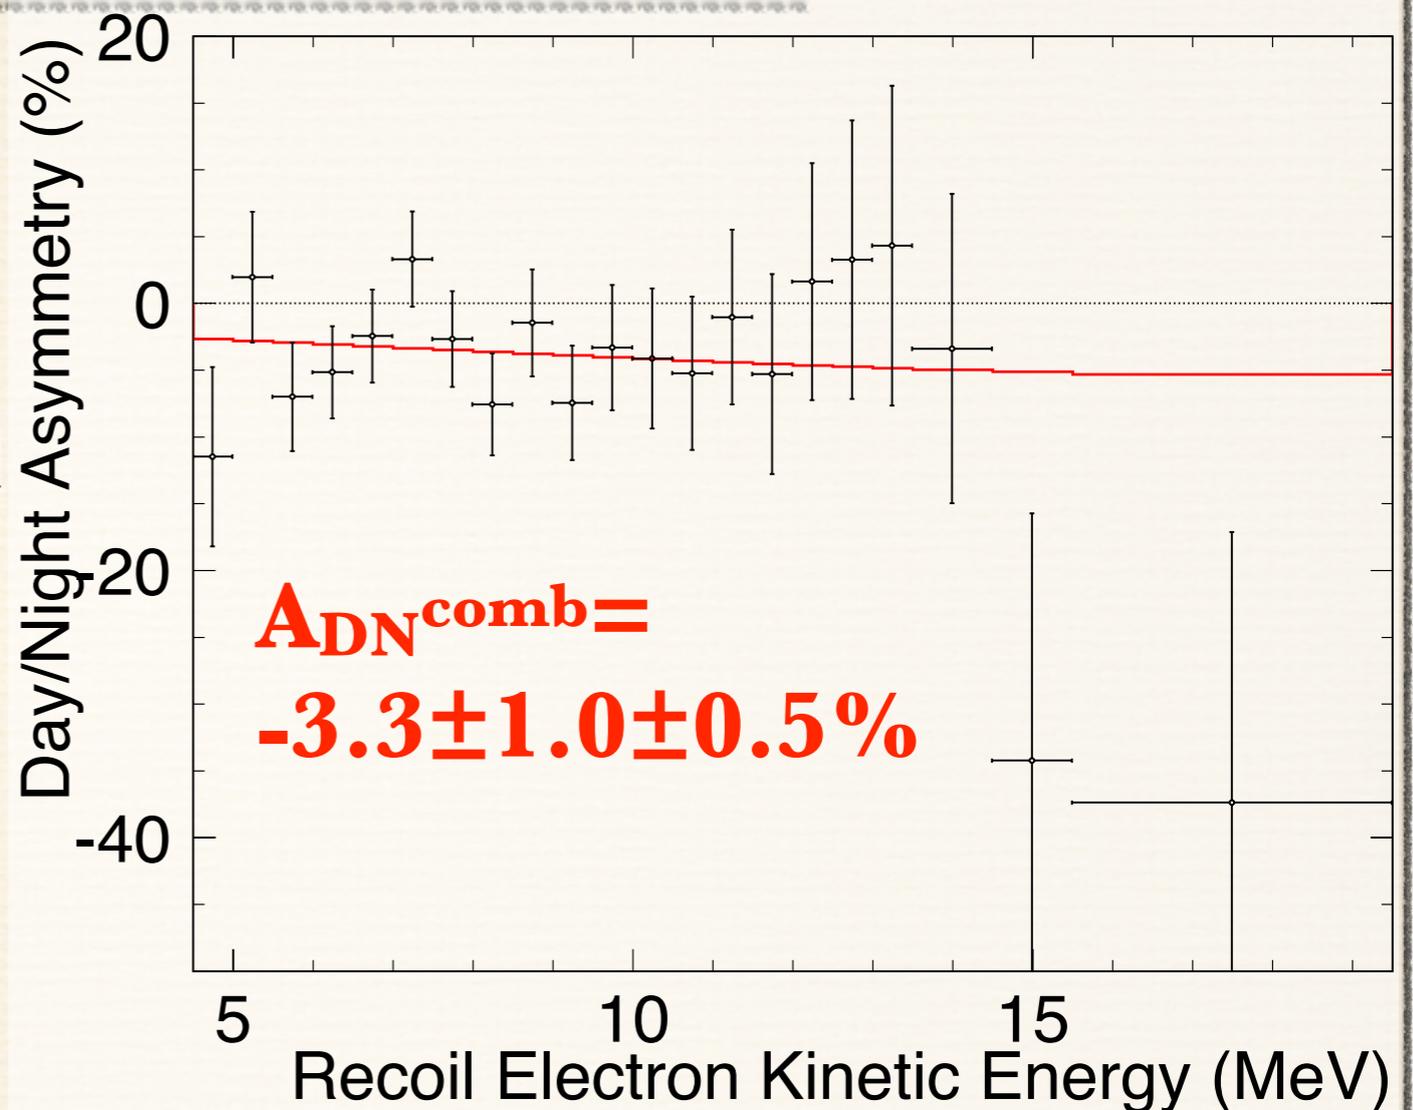

# Earth Matter Effects

- ❖ direct test: compare flavor content of the same “beam” with and without matter being present
- ❖ with current parameters: no effect below few MeV; large effect near  $\sim 50$  MeV, a few % for  ${}^8\text{B}$  neutrinos
- ❖ form asym.  $A_{\text{DN}} = 2(\text{D}-\text{N})/(\text{D}+\text{N})$
- ❖ mostly a “regeneration” effect:  $P_{ee}^{\text{night}} > P_{ee}^{\text{day}}$  ( $A < 0$ )
- ❖ searched for by Super-K, SNO ( $E_\nu > \text{few MeV}$ ) and BOREXINO ( $E_\nu = 0.86$  MeV)
- ❖ no significant non-zero  $A_{\text{DN}}$  from SNO or BOREXINO
- ❖  $2.8\sigma$  indication from Super-K

# Super-K Result and its Future

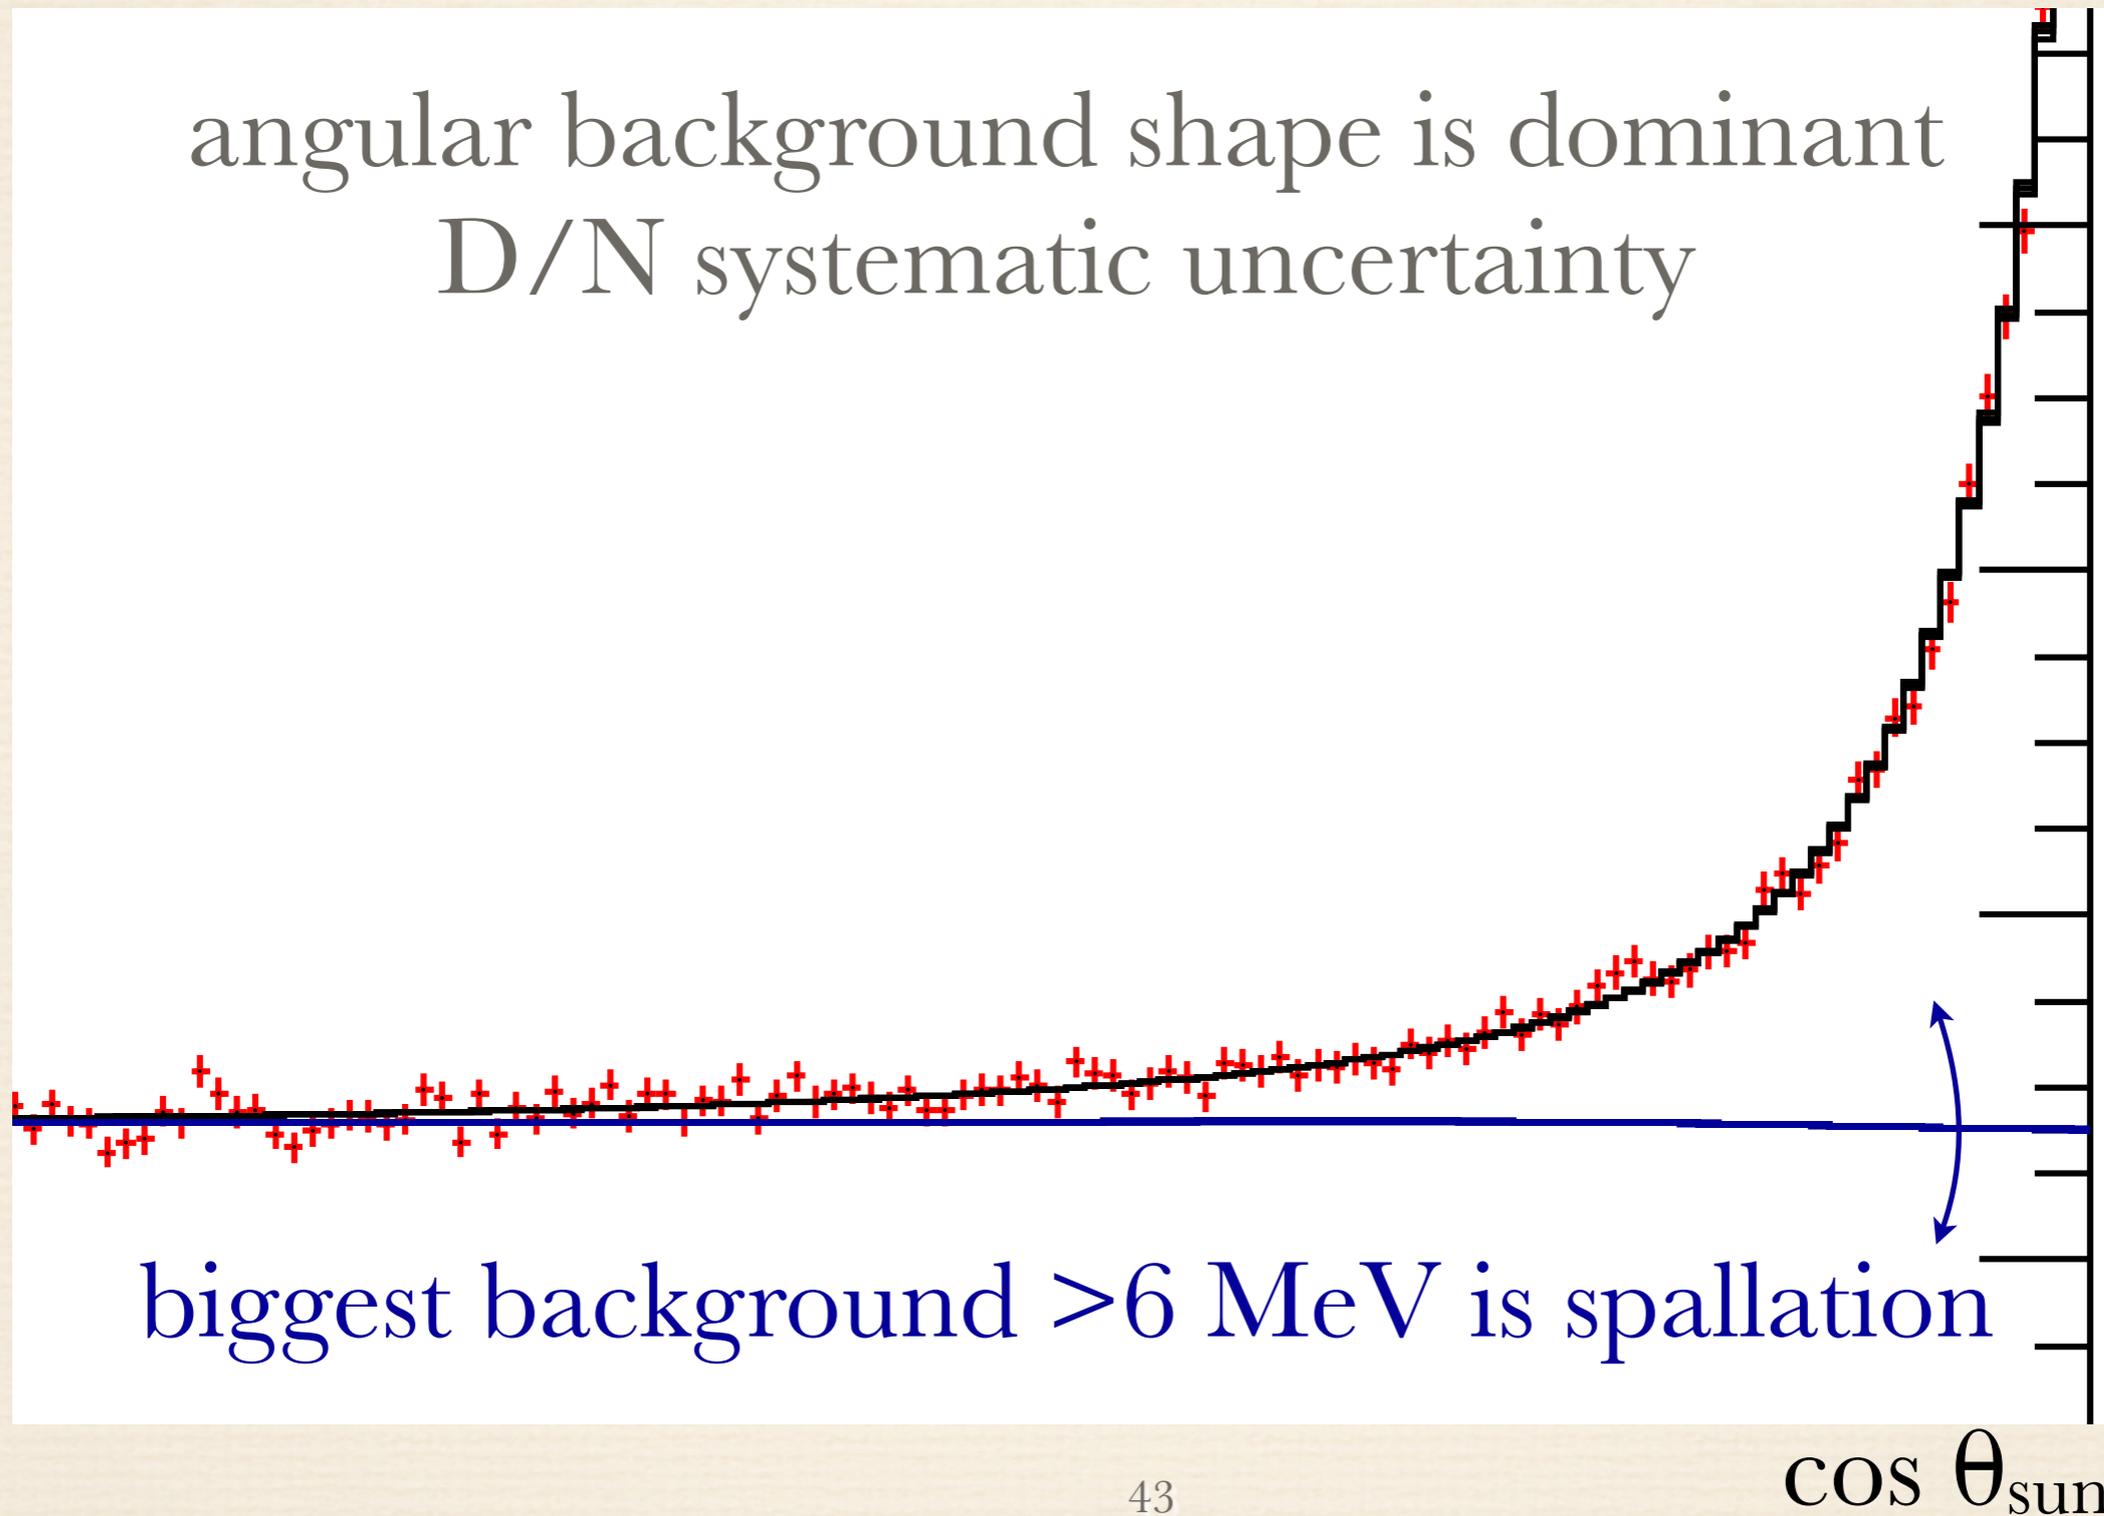

- ❖ currently  $\sim 3\sigma$  significance for  $A_{\text{DN}} \neq 0$
- ❖ Super-K-IV uncertainty by itself is  $\pm 1.6 \pm 0.6\%$ , with full data set (60% more data), it should reach  $\pm 1.3 \pm 0.4\%$
- ❖ combined  $\sigma_{A_{\text{DN}}} = 0.9 \pm 0.4\%$
- ❖ expect  $\sim 3.4\sigma$  significance, if same central value

to reach  $>5\sigma$  in reasonable time, need larger event rate, reduction in systematic uncertainty, better control of spallation background will achieve both

# D/N Systematic Uncertainty

angular background shape is dominant  
D/N systematic uncertainty

# Nuclear Spallation Background in Water

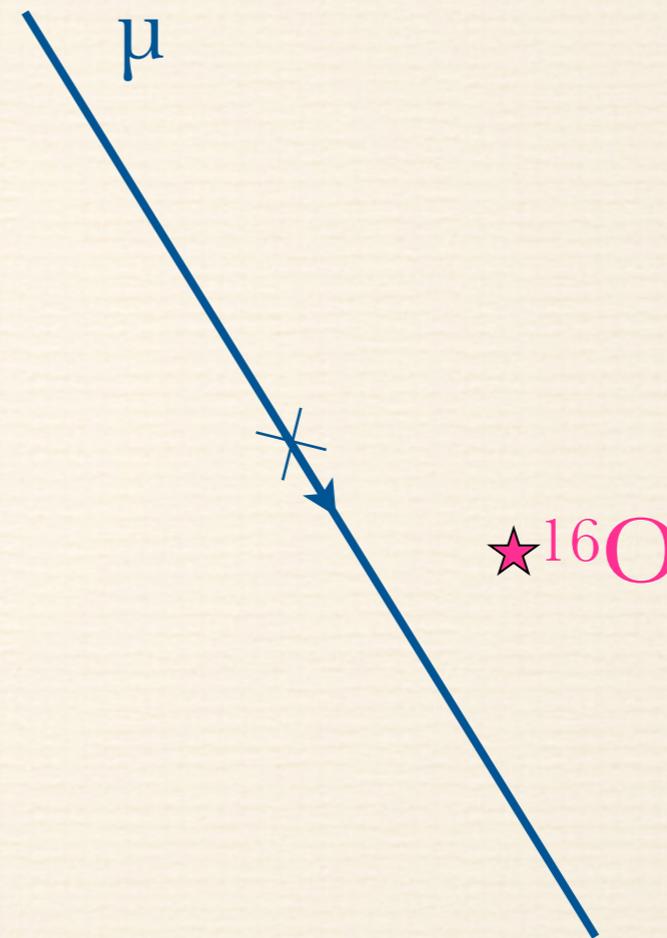

---

- ❖ mechanism: muon occasionally starts showers,
- ❖ some showers contain hadrons; e.g. neutrons or,  $\pi^\pm$
- ❖ these break up the oxygen nucleus and change them to radioactive elements:  $^{16}\text{N}$ ,  $^{12}\text{B}$ , and many others
- ❖ after some msec's to sec's, these elements  $\beta\gamma$  decay and make background
- ❖ the decay locations are close to the muon tracks, but directly correlate with the volume covered by the shower

★ $^{16}\text{O}$

# Nuclear Spallation Tagging

- ❖ traditionally, form likelihood based on time difference to muon, distance to muon track, and excess light of the muon above the MIP expectation (from electromagnetic component of the showers)
- ❖ in 2012, we invented a new method for the distant supernova neutrino search: the muon  $dE/dx$  profile (using water Cherenkov detectors as a TPC) points out the spallation location

# Hadronic Showers

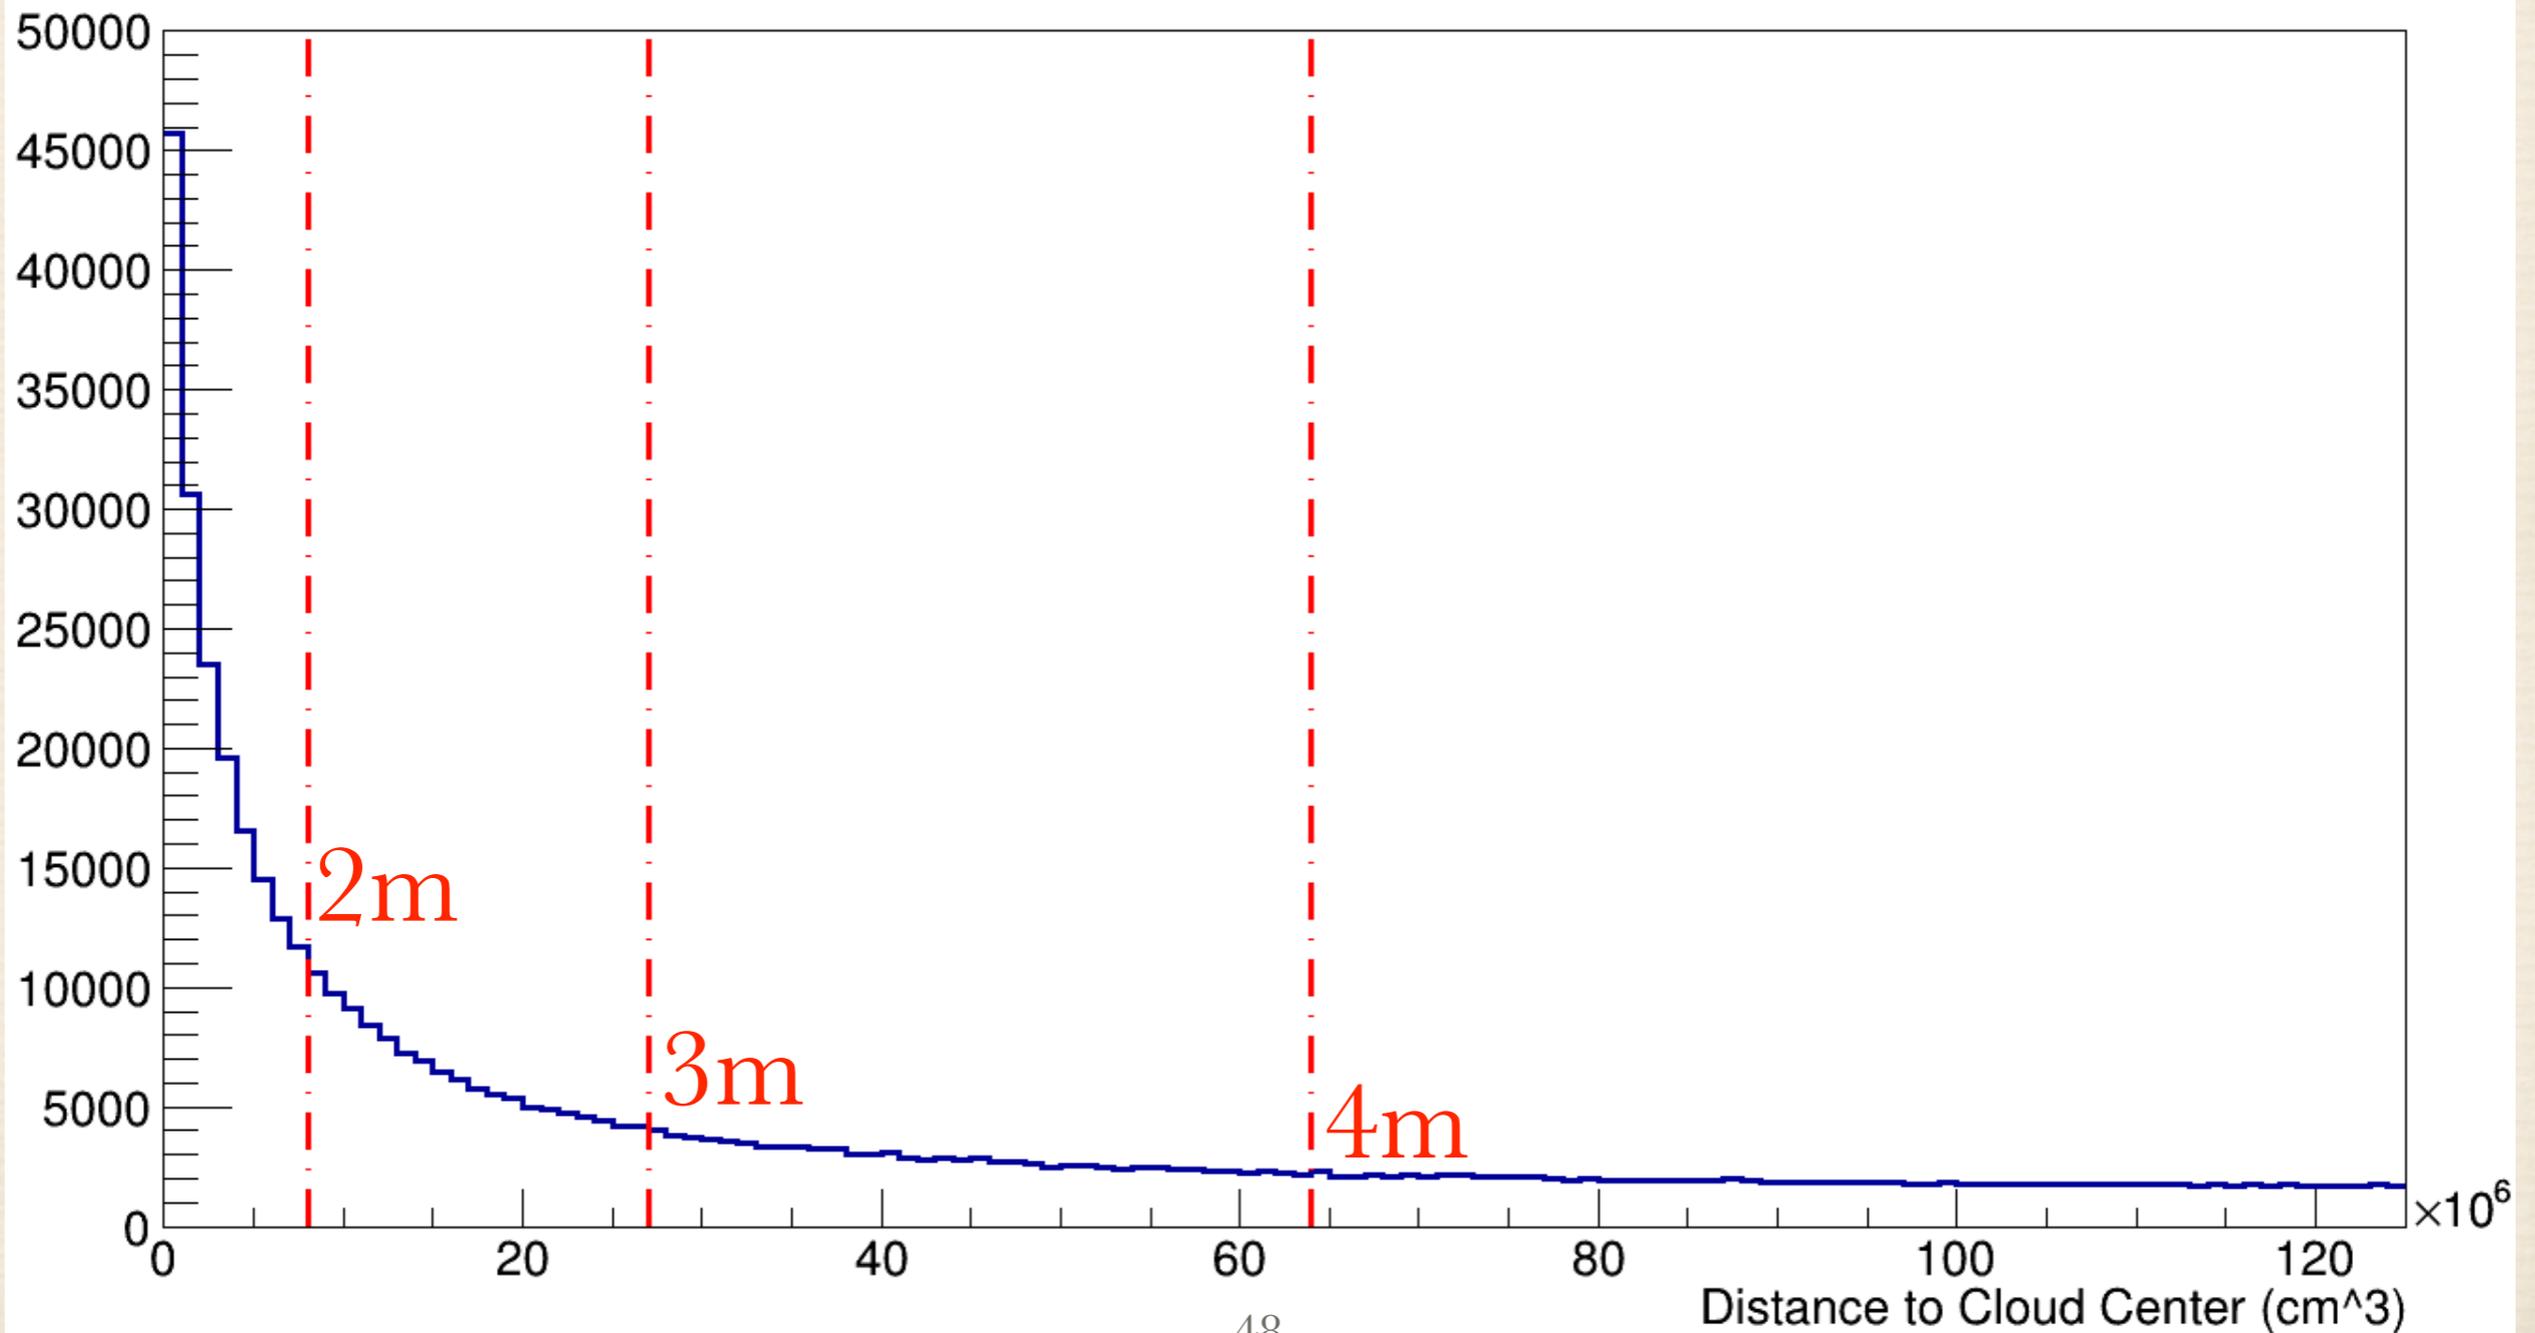

- ❖ neutrons after muons are spatially correlated with neutrons and each other: neutrons tag  $^{16}\text{N}$  production as well as indicate the 3D location of the decay
- ❖ reduce Super-Kamiokande's dominant spallation background

# Finding Spallation Decays

- simplest way: events within 1 minute near the average neutron capture vertices

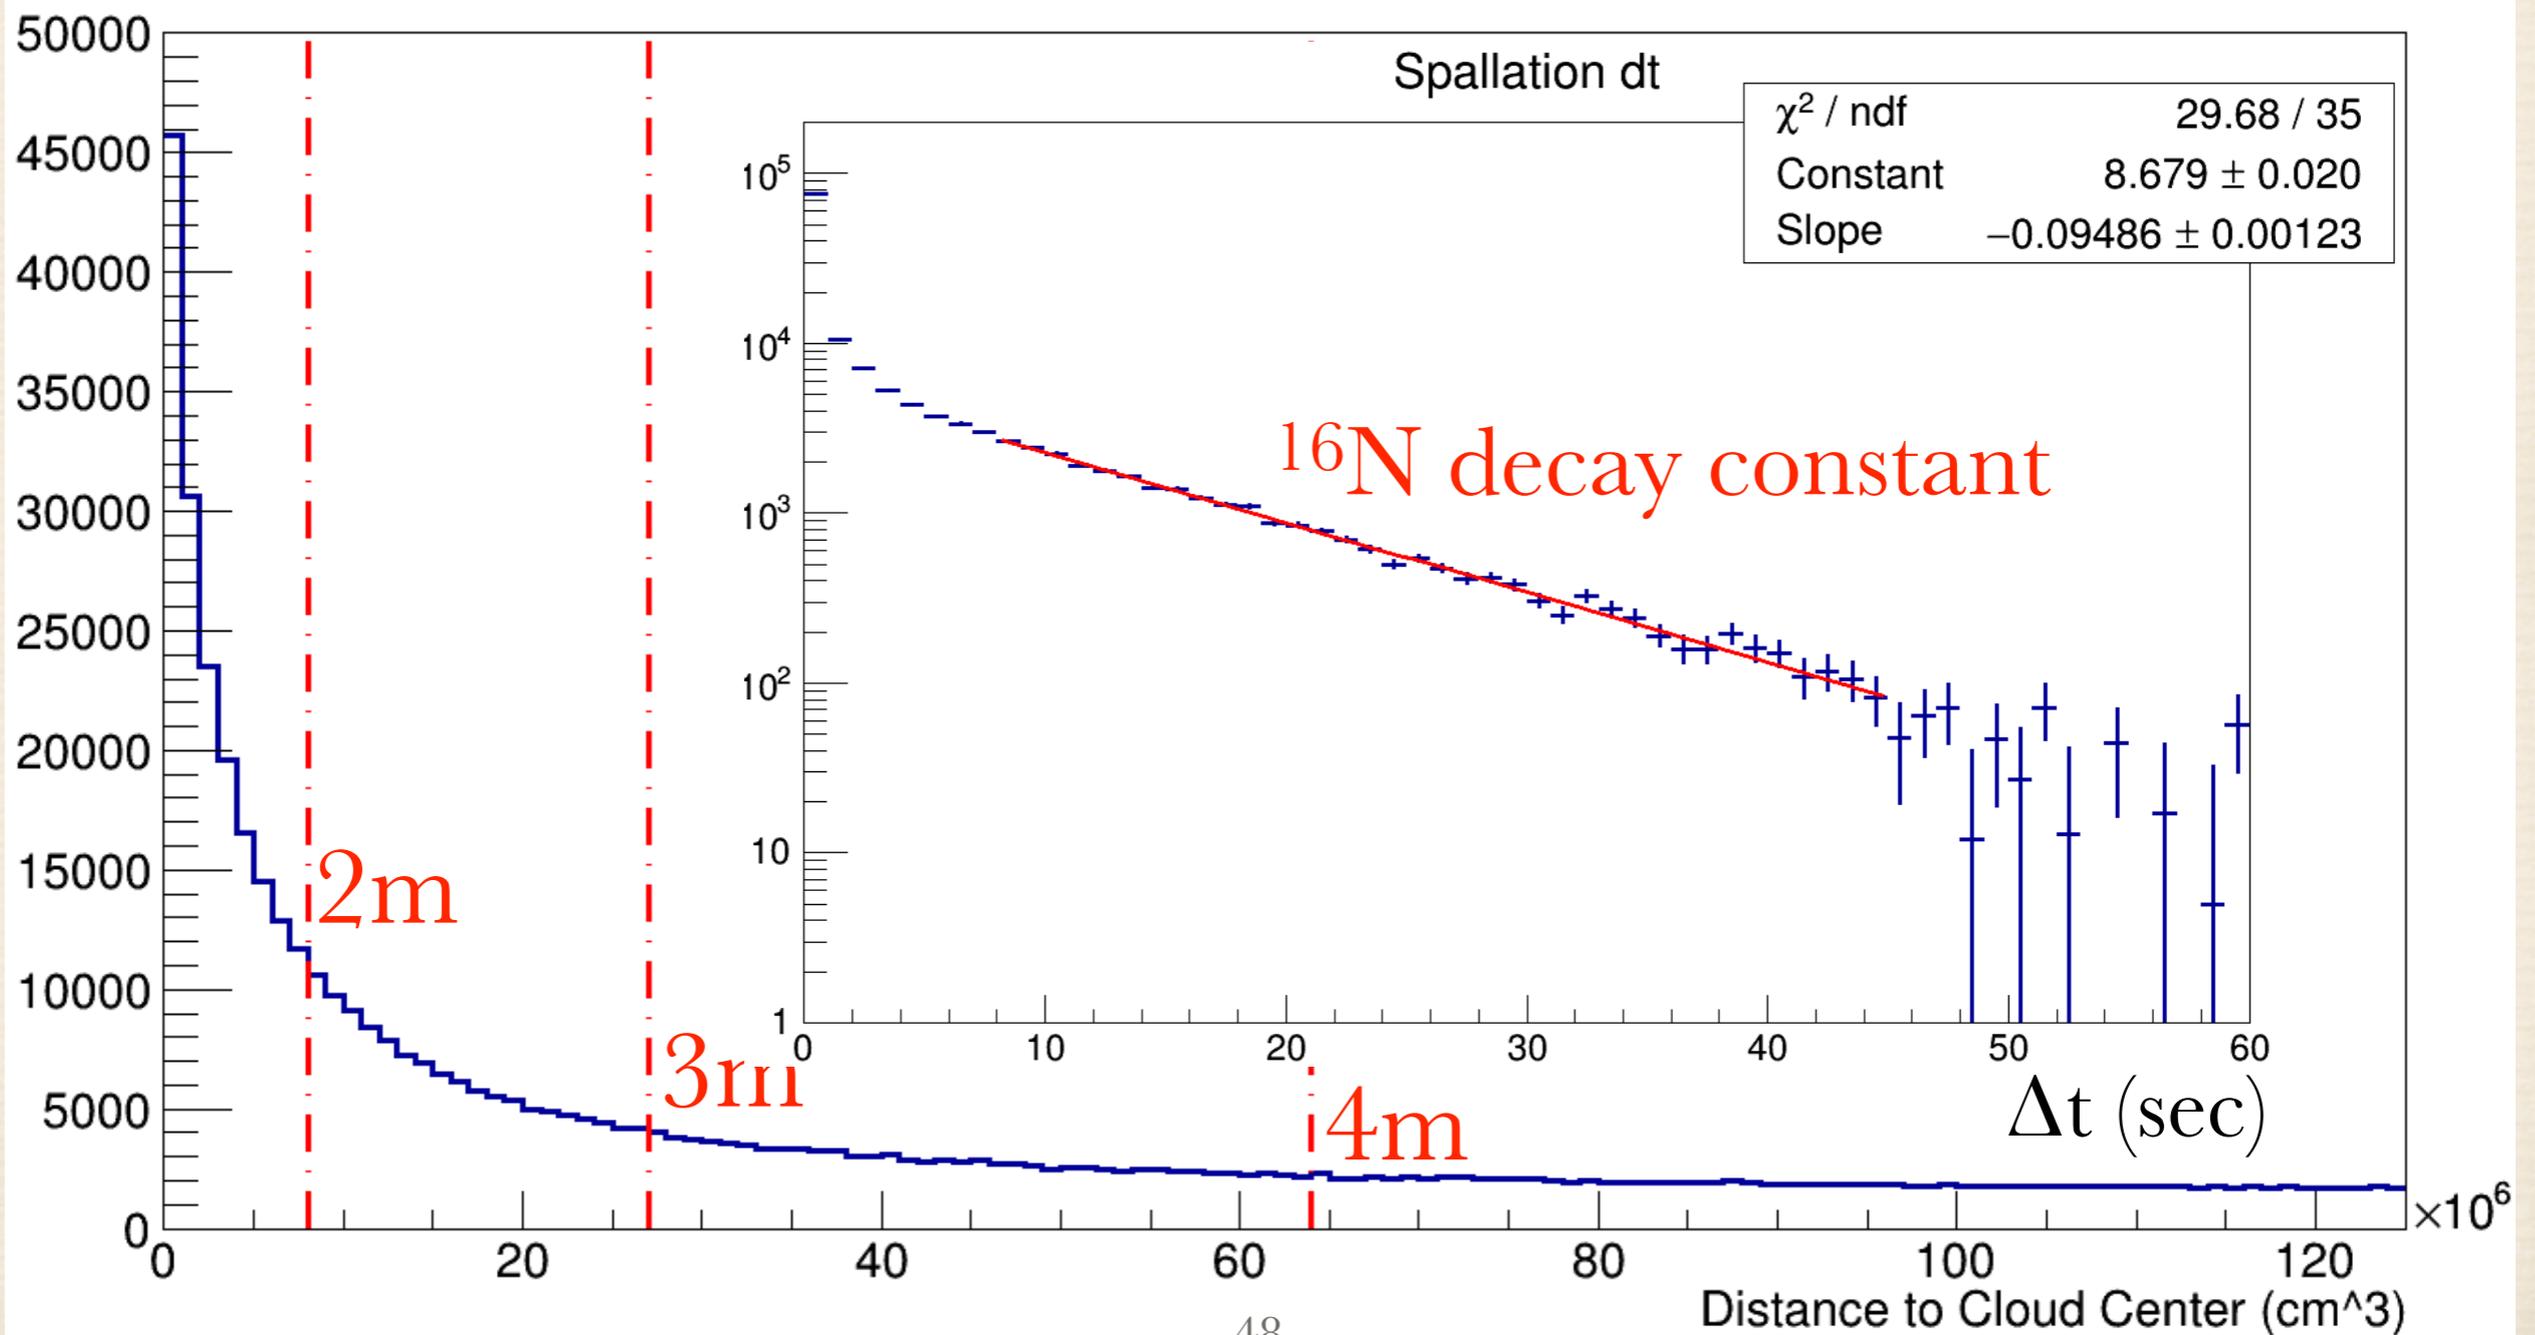

Spallation Distance<sup>3</sup> to Center of Neutron Cloud

# Outlook

- ❖ still many interesting questions in solar neutrino land
- ❖ particle physics: solar MSW effect, terrestrial matter effects, CPT invariance (compare KamLAND/JUNO oscillation parameters governing  $\bar{\nu}_e$ 's with solar fit)
- ❖ solar and astrophysics: metallicity, solar models
- ❖ terrestrial physics: reconstruct electron density and earth's chemical composition (by comparison with matter density from seismic measurements)
- ❖ can still learn a lot from Super-K data
- ❖ galactic core-collapse supernova will have large impact, if one shows up in the next few years
- ❖ hope to discover distant supernova neutrinos in the next decade
